1. SUMMARY

Six holes for 1470,3 metres were drilled by Groupe Agnico-Eagle Division Exploration on the Jouval Cominco - Agnico-Eagle joint-venture from 1991/02/04 to 1991/02/21.

The drill program has tested systematically an I.P. trend interpreted to correspond to a sedimentary sequence hosting potentially auriferous iron carbonate units. This lithotype is the dominant host of the gold mineralization of the Eagle-Telbel deposits located immediately South-East of the Jouval property.

All holes intersected a stratigraphic sequence fairly consistant along strike. The sequence faces North-East and is made up, from South-West to North-East of i) the Lower Volcaniclastites, ii) the Sediments that includes iron carbonate unit, and iii) the Upper Volcaniclastites. The best result of this program is 360 ppb Au over 1,5 metres.

2. INTRODUCTION

Six holes for 1470,3 metres were drilled from 1991/02/04 to 1991/02/21 by Forage Moderne Inc. for the Exploration Division of the Agnico-Eagle Group on the Jouval property, a Cominco Ltd - Agnico-Eagle Mines Ltd joint venture.

Targets were selected on the basis of results obtained from magnetometer and, particularly, I.P. surveys, to test systematically a strike-length of two kilometres of potentially favorable lithologies for Eagle-Telbel-type gold mineralization. The area of investigation was North-West of the area tested during the 1990 winter drill program.

3. LOCATION, PHYSIOGRAPHY AND ACCESS

The Jouval property is located in the Joutel and Valrennes Townships (NTS 32E, 09), Abitibi district, Northwestern Québec. More specifically, the property is located 7 to 12 km North-West of the town of Joutel, and 1,5 to 6,5 km North-West of the Eagle Mine shaft. The property is traversed by the North-West-flowing Harricana River. The land is generally flat lying with maximum relief of 25 metres mostly along the left banks of the River. The land is poorly drained though some creeks traverse it and drain into the River. The Harricana banks are characterized by a very mature poplar and birch forest. Swamps and spruce forest are typical of the land away from the River banks. Outcrops are rare and restricted to the left banks of the Harricana River, typically along the River itself. The overburden is up to 25 m thick with an average thickness of 15 m; it is composed of varved clays and silts.

Access to the property is provided by the Harricana River all year long, and by bush roads during winter. These bush roads are accessible from the main road from Joutel to the Eagle-Telbel mine site.

The drilling reported here was carried out on the northwestern part of the property.

4. CLAIM LIST

The 1991 drill program was carried out on the claims listed below:

388644-1

388644-2

388645-1

388645-2

388646-1

388646-2

388647-1

388647-2

5. DRILL SUMMARY

JV-91-10

24+00W Az.: 217 Total depth: 246,0 m
0+06S Pl.: -50

Summary log

000,00-018,00 Overburden
018,00-080,83 Felsic volcaniclastites
080,83-157,40 Sediments
 080,83-081,30 Magnetite-chert iron formation
 081,30-148,08 Heterogeneous sequence of clastic sediments.
 with minor chert
 148,08-157,40 Iron carbonate unit
157,40-246,00 Felsic and porphyritic intermediate tuffs
 157,40-189,20 Felsic tuff
 189,20-217,00 Massive feldspar phryic intermediate tuff
 217,00-246,00 Hybrid sequence of quartz eye tuff and massive
 feldspar phryic intermediate tuff
246,00 End of hole

Pyritic sediments from 142,1 to 157,4 explain the I.P. anomaly. Best gold value was 154 ppb, within the pyritic iron carbonate unit.

JV-91-11

28+00W Az.: 217 Total depth: 246,0 m
0+40S Pl.: -50

Summary log

000,00-011,90 Overburden
018,00-086,10 Felsic volcaniclastites
086,10-160,75 Sediments
 086,10-152,07 Heterogeneous sequence of clastic sediments
 with minor chert and graphitic argillite
 152,07-154,30 Iron carbonate unit
 154,30-160,75 Heterogeneous sequence of ankeritic clastic
 sediments
160,75-244,50 Felsic and porphyritic intermediate tuffs
 160,75-172,50 Felsic tuff
 172,50-209,80 Massive feldspar phryic intermediate tuff
 209,80-230,50 Hybrid sequence of quartz eye tuff and massive
 feldspar phryic intermediate tuff
 230,50-244,50 Felsic to intermediate tuff
246,00 End of hole

Several beds of pyritic and graphitic sediments within the sedimentary sequence explain the I.P. anomaly. Best gold value was 86 ppb, within the pyritic iron carbonate unit.

JV-91-12

36+00W Az.: 217 Total depth: 246,0 m
 0+85S Pl.: -50

Summary log

000,00-031,00 Overburden
 031,00-065,32 Felsic volcaniclastites with minor clastic sediments
 065,32-185,80 Sediments
 065,32-138,00 Heterogeneous sequence of clastic sediments
 with minor chert and graphitic argillite
 138,00-150,10 Iron carbonate unit
 150,10-185,85 Heterogeneous sequence of ankeritic clastic
 sediments with minor felsic tuff
 185,80-246,00 Felsic and porphyritic intermediate tuffs
 185,80-202,20 Felsic tuff
 202,20-232,00 Massive feldspar phryic intermediate tuff
 232,20-246,00 Hybrid sequence of quartz eye tuff and massive
 feldspar phryic intermediate tuff
 246,00 End of hole

Several beds of pyritic and graphitic sediments within the sedimentary sequence explain the I.P. anomaly. Best gold value was 360 ppb, within the pyritic iron carbonate unit. This hole has the best intersection of the program with an average of 129 ppb Au over 13,2 metres that corresponds to the thickest and most pyritic iron carbonate unit drilled during this program.

JV-91-13

32+00W Az.: 217 Total depth: 246.0 m
 0+65S Pl.: -50

Summary log

000,00-022,00 Overburden

022,00-049,85 Felsic volcaniclastites
049,85-147,00 Sediments
 049,85-135,38 Heterogeneous sequence of clastic sediments
 with minor chert, graphitic argillite and
 felsic tuff
 135,38-139,52 Iron carbonate unit
 139,52-147,00 Heterogeneous sequence of ankeritic clastic
 sediments with minor felsic volcaniclastites
147,00-246,00 Felsic and porphyritic intermediate tuffs
 147,00-155,20 Felsic tuff
 155,20-246,00 Hybrid sequence of quartz eye tuff and massive
 feldspar phryic intermediate tuff
246,00 End of hole

Several beds of pyritic and graphitic sediments within the sedimentary sequence explain the I.P. anomaly. Best gold value was 249 ppb, within the pyritic sediments.

JV-91-14

44+00W Az.: 217 Total depth: 243,3 m
1+95S Pl.: -50

Summary log

000,00-016,00 Overburden
016,00-138,50 Sediments
 016,00-135,10 Heterogeneous sequence of clastic sediments
 with minor chert and graphitic argillite
 135,10-137,00 Iron carbonate unit
 137,00-138,50 Heterogeneous sequence of ankeritic clastic
 sediments
138,50-243,30 Felsic and intermediate tuff
243,30 End of hole

Several beds of pyritic and graphitic sediments within the sedimentary sequence explain the I.P. anomaly. Best gold value was 20 ppb, within the pyritic sediments.

JV-91-15

40+00W Az.: 217 Total depth: 243,0 m
0+40S Pl.: -50
Z

Summary log

000,00-025,00 Overburden

025,00-037,30 Felsic volcaniclastites

037,30-161,50 Sediments

 037,30-137,00 Heterogeneous sequence of clastic sediments
 with minor chert, graphitic argillite and
 felsic tuff

 137,00-151,50 Iron carbonate unit

 151,50-161,50 Heterogeneous sequence of ankeritic clastic
 sediments

161,50-243,00 Felsic and porphyritic intermediate tuffs

 161,50-186,60 Felsic tuff

 186,60-223,90 Massive feldspar phryic intermediate tuff

 223,90-243,00 Hybrid sequence of quartz eye tuff and massive
 feldspar phryic intermediate tuff

243,00 End of hole

Several beds of pyritic and graphitic sediments within the sedimentary sequence explain the I.P. anomaly. No detected gold in this hole.

6. GEOLOGY OF THE NORTHWESTERN HALF OF THE JOUVAL PROPERTY

6.1 INTRODUCTION

The 1991 drill programm on the Jouval property has confirmed the interpretation, based on the magnetometer, MaxMin and I.P. surveys of the 1990 summer, that a strong I.P. trend across the entire lenght of the property was related to a sedimentary sequence. The drill program has also confirmed the presence of an iron carbonate unit, the most favorable lithotype of the area for gold mineralization (Simard and Genest, 1990; Dubé et al., 1991), within this sedimentary sequence.

6.2 LITHOSTRATIGRAPHY

The six holes drilled during this program have intersected broadly similar lithological sequences. The typical sequence, from South-West to North-East, is made up of i) the Lower Volcaniclastites, of unknown thickness, overlain successively by ii) 50 to more than 85 metres of sediments and iii) by 100 to 150 metres of the Upper Volcaniclastites. Units strike North-West and are subvertical to steeply north-dipping.

6.2.1 Lower Volcaniclastites

The Lower Volcaniclastites package is made up, from South-West to North-East, of the following four units:

- A. Strongly sheared volcaniclastic rocks of felsic composition, heterogeneously sericitic, hematitic and chloritic (see section on structure below for more details);
- B. Interlayered quartz eye sericitic tuff and feldspar phryic chloritic tuff, the later similar to the overlying lithotype (C);

- C. Massive feldspar phryic chloritic tuff and lapilli-tuff; and
- D. Quartz eye sericitic tuff.

Unit C is absent in hole JV-91-13 where unit B is more extensive. Units B, C, and D are absent or too deformed to be recognized in hole JV-91-14 where a strong shear zone occurs Southwest of the sedimentary sequence.

6.2.2 Sediments

Clastic sediments dominate the Sediment. A very homogeneous green quartziferous arenite in massive tick beds is the most common lithotype, which is interbedded with thinner beds of lithic conglomerate. Narrow packages of siltstone, graphitic argillite and chert, together with minor ash tuff are interlayered within the coarse clastic sediments. An iron carbonate unit occurs near the base of the sedimentary sequence, directly above a sequence of ankeritic clastic sediments. A felsic volcaniclastic unit is interlayered with the ankeritic sediments in holes JV-91-12 and JV-91-13.

6.2.3 Upper Volcaniclastites

The Sediments are overlain by tuffs and lapilli-tuffs made up of various amounts of quartz crystals, feldspar crystals, chloritic shards and felsic lithic fragments. These lithologies outcrop South East of the area covered by the drill program, and include felsic volcanoclastic breccia that were not intersected by drill holes.

6.2.4 Lithostratigraphy of the area

Compilation of previous drilling and mapping programs for the area indicate that the Upper Volcaniclastites are overlain successively by 30 to 100 metres of Porphyritic Andesite, 10 to 50

metres of Felsic Rocks together with minor chemical sediments, and by more than 100 metres of siltstone, argillite and sandstone.

The stratigraphy of the Jouval area appears broadly similar to, and probably correlable with, the stratigraphy of the Eagle-Telbel area. We propose here that the Lower Volcanoclastites, the Sediments, and the Upper Volcanoclastites intersected in this drill programm, as well as the Porphyritic Andesite and the Siltstone-argillite-sandstone sequence correlate with, respectively, the footwall felsic rocks, the sediments that include auriferous iron carbonate units, the felsic volcanoclastites, the andesite and the Harricana sediments of the mine sequence of the Eagle and Telbel deposits (see Simard and Genest, 1990; Dubé *et al.*, 1991).

6.3 STRUCTURE

The continuity along strike of the different units and rare graded bedding in clastic sediments that indicate stratigraphic top to the North-East suggest that the sequence drilled is an homoclinal striking North-West and steeply dipping toward the North-East.

The strain is more important toward the South-West within the Lower Volcaniclastites. Less deformed rocks are typically chloritic and weakly foliated. Moderately deformed rocks are characterized by sericitic spaced cleavages (S_1) at low angle to the bedding (S_0). Strongly deformed rocks show a more uniform sericitic cleavage (S_1) and a well-developed sericitic crenulation cleavage (S_2) at high angle to S_1 .

The stronger shearing toward the South-West suggest the proximity of a major shear zone that may corresponds to the southwestern limit of the homoclinal. The sediments of the Harricana Sedimentary Basin (Lacroix *et al.*, 1990) are typically cutted by graphitic shear zones. Similarly, a graphitic shear zone occurs at the contact between the sediments of the Harricana Sedimentary

Basin and the volcanites of the Cartwright Domain, suggesting that this major contact may be the northeastern limit of the homocline.

Within the homocline, the deformation is usually weak to moderate, except in the northwesternmost part of the Jouval property where most of the sequence intersected in hole JV-91-14 is strongly sheared. The more complex stratigraphic relationships in the northwestern part of the Jouval property are best explained, therefore, by structural complications due to shearing and faulting.

6.4 ECONOMIC GEOLOGY

The gold content of the iron carbonate unit, although low, shows a zonation along strike and is anomalous in holes JV-91-10 to JV-91-13, with better values in the area of holes JV-91-12 and JV-91-13.

Traces of chalcopyrite were present in hole JV-91-13 and JV-91-15. Two occurrences of chalcopyrite in hole JV-91-13 were within the Lower volcanoclastites, more specifically associated to a quartz vein and to a chloritic zone. In hole JV-91-15, the chalcopyrite is in quartz-dolomite-pyrite veins concentrated within a chloritic zone.

7. RECOMMENDATIONS

The results of this drill program were disappointing. However, the presence of the favorable lithotype is now established and anomalous gold values occur in holes JV-91-12 and JV-91-13. Considering i) the limited strike-length (~150 metres) of the recently discovered Eagle West zone on the Eagle-Telbel properties, ii) the relatively wide spacing (400 metres) retained for the systematic investigation of the favorable lithotype, and iii) the abrupt change in gold grade within the favorable lithotype around the Eagle West deposit (from economic values within the deposit to basically undetectable gold values around it), we conclude that the area of holes JV-91-12 and JV-91-13 is still of interest.

A lithogeochemical program of the volcanoclastites is recommended to determine the type of regional alteration and to detect potential alteration zones directly related to the pyritic and auriferous portion of the iron carbonate unit.

ABSTRACT

This hole was drilled to test systematically an IP trend interpreted to correspond to a sedimentary sequence hosting iron carbonate. The iron carbonate has been found from 140.08 to 157.4 m. Best result in this hole is 154 ppp from 148.08 to 148.80 m.

Pascal et al

ABSTRACT

This hole was drilled to test an IP trend interpreted to correspond to a sedimentary sequence hosting iron carbonate. The iron carbonate was found from 152.07 to 154.3 m. Best result in this hole is 86 ppb from 151.4 to 152.07 m.

ABSTRACT

Pascal Mayr

This hole was drilled to test an IP trend interpreted to correspond to a sedimentary sequence hosting iron carbonate. The iron carbonate has been found from 138 to 150.1 m. The best result in this hole is 360 ppb from 144.3 to 145.8 m.

ABSTRACT

This hole was drilled to test an IP trend interpreted to correspond to a sedimentary sequence hosting iron carbonate. Iron carbonate has been found from 135.37 to 139.52 m. Best result in the hole is 249 ppb from 128.9 to 131.7 m.

ABSTRACT

Handwritten signature

This hole was drilled to test an IP trend interpreted to correspond to a sedimentary sequence hosting iron carbonate. Iron carbonate has been found from 135.1 to 137 m. Best result in hole is 20 ppb.

SUMMARY LOGJV-91-14
Page 2

From(m) To(m) Field Name (Legend)

| | | |
|--------|--------|--|
| 0.00 | 16.00 | Overburden (OVB) |
| 16.00 | 36.40 | Green sandstone (S3av) |
| 36.40 | 39.00 | Grey chert/siltstone/conglomerate (Ch/S2/S1) |
| 39.00 | 63.80 | Conglomerate (S1o {V9aq}) |
| 63.80 | 68.65 | Yellowish sandstone/grey-greenish siltstone (S3/S2) |
| 68.65 | 105.10 | Sandstone (green)/conglomerate (S3av/S1) |
| 68.65 | 76.20 | Conglomerate (S1) |
| 87.20 | 88.80 | Conglomerate (S1) |
| 105.10 | 106.80 | Grey chert/siltstone/argillite (Ch/S2/S4/S3) |
| 106.80 | 116.00 | Green sandstone (S3av) |
| 116.00 | 135.10 | Siltstone/argillite (S4/S2) |
| | | Argillite beds are graphitic from 116 to 119.5 m; this zone is sheared and crenulated. |
| 135.10 | 137.00 | Iron carbonate (F4(a) 3%Py) |
| 137.00 | 138.50 | Siltstone/white conglomerate (ankeritic), 2% pyrite (S2/S1) |
| 138.50 | 148.50 | Felsic sheared tuff (V9a) |
| | | Fault zone with gouge from 138.5 to 141. |
| 148.50 | 243.30 | Chloritic sheared and crenulated tuff (V9i) |
| | | Increasing shearing downhole, several gouges and crenulated zones (from 181 to 210 m and from 222 to 243.3 m). |
| 157.50 | 168.00 | 1-5% pyrite |
| 211.00 | 239.00 | Hematized |
| 243.30 | | END OF HOLE. |

ABSTRACT

Pascal Marquis

This hole was drilled to test a IP trend interpreted to correspond to a sedimentary sequence hosting iron carbonate. Iron carbonate was found from 137 to 151.5 m. No detected gold in this hole.

SUMMARY LOG

04-26-1991 :: 16:28

JV-91-15
Page 2

From(m) To(m) Field Name (Legend)

| | | |
|--------|--------|--|
| 0.00 | 25.00 | Overburden (OVB) |
| 25.00 | 37.30 | Felsic (quartz) crystal tuff (V9aqg) Chloritic zones hosting quartz-pyrite-(chalcopyrite) veins from 25.6 to 25.8 m, from 28.45 to 30 m, and from 36.1 to 37.3 m. Ankeritic halos around quartz-dolomite-chalcopyrite veins. Fault zone with gouge from 28.4 to 30 m. |
| 37.30 | 41.60 | Sandstone/siltstone/argillite (S3/S2/S4) |
| 41.60 | 71.30 | Green sandstone (S3av(c)) |
| 71.30 | 96.70 | Sheared felsic tuff (V9a) Sheared and crenulated from 71.3 to 75.5 m and from 95.65 to 96.7 m. |
| 96.70 | 125.00 | Sandstone/siltstone (S3(cv)/S2) |
| 125.00 | 125.90 | Siltstone/graphitic argillite/chert (S2/S4g/Ch) |
| 125.90 | 137.00 | Sandstone-conglomerate (debris-flow), 2-10% pyrite (S3cd {Ch} 2-10%Py) |
| 137.00 | 151.50 | Iron carbonate, silicified, 10-15% pyrite. (F4s 10-15%Py) |
| 151.50 | 157.70 | Sandstone/siltstone/conglomerate. Ankeritic. (S3/S2/S1) |
| 157.70 | 161.50 | Heterogeneous ankeritic sedimentary sequence, 2-3% pyrite (S3/S1) Sheared, punctually crenulated. |
| 161.50 | 186.60 | Felsic tuff (V9a/(S3)) |
| 186.60 | 223.90 | Feldspar porphyry (V9if) |
| 223.90 | 243.00 | Feldspar porphyry / Felsic tuff (V9if/V9a) Shear zone, almost mylonitic, crenulated. |
| 243.00 | | END OF HOLE. |
