**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

**INTRODUCTION**

In the course of the Otish diamond exploration activity, a property has been acquired by Northern Empire Minerals Ltd adjacent to the upper course of the Eastmain River, north of the Otish Mountains, central Québec. This property is located about 130 kilometers to the south-west of Renard kimberlite cluster recently discovered by Ashton-Soquem, 65 kilometers to the west of Ditem's Beaver Lake kimberlite and H-Complex, and 70 kilometers to the north of the Papaskwasati dispersion train held by Soquem, Majescor, Dios and Plexmar.

In August 2002, Northern Empire Minerals Ltd carried a systematic glacial sediments survey over the property in order to evaluate its preliminary diamond potential. Discovery of 9 kimberlitic indicator minerals, including valuable harzburgitic garnets, spurred Stornaway Ventures Ltd (formerly Northern Empire) to proceed with a follow-up sampling program upon the formerly outlined targets.

**TERMS OF REFERENCES**

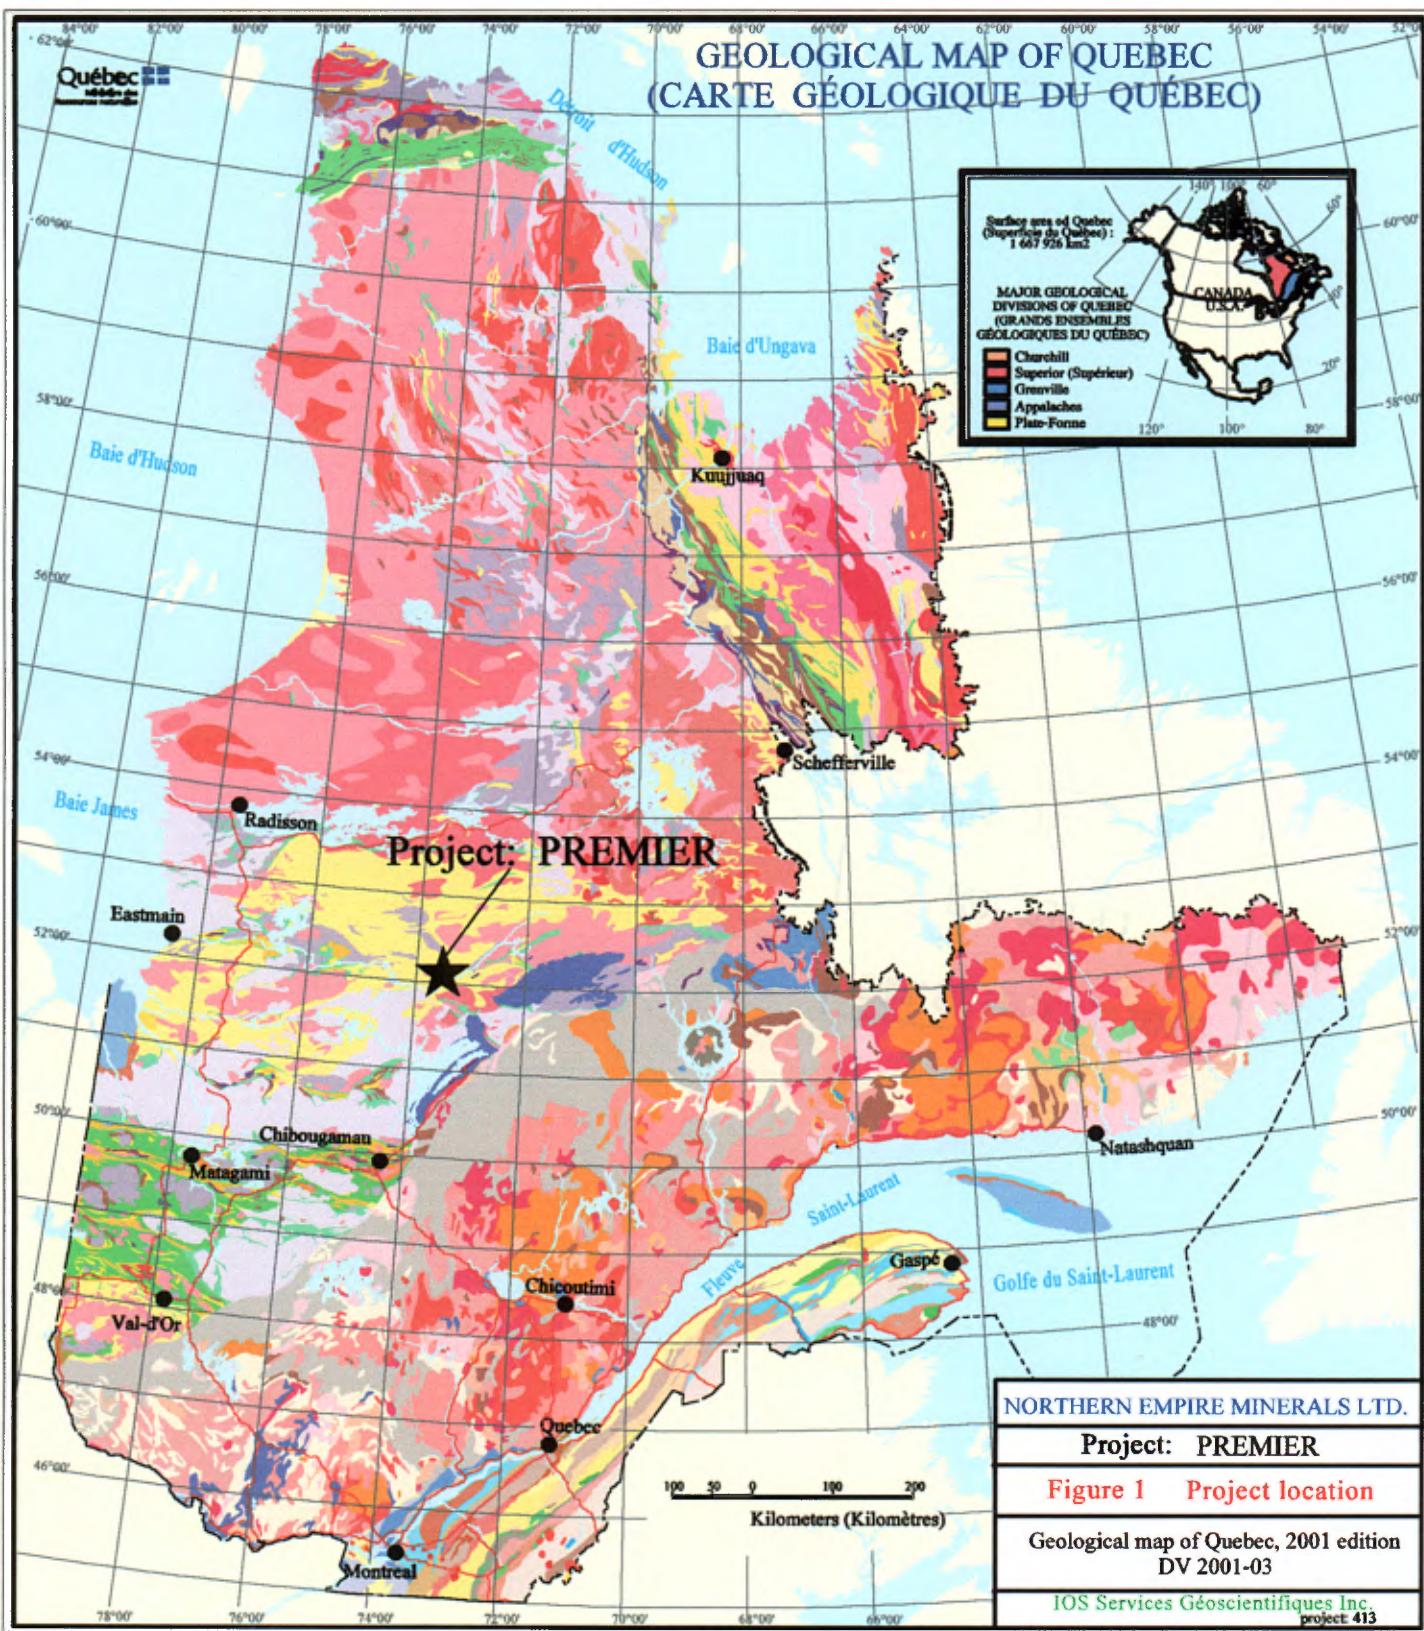

Stornaway Ventures Ltd requested IOS Services Géoscientifiques Inc to organize and carry a sampling program over the Premier property in accordance with a specified budget. IOS has been responsible for implementation of field work, selection of sampling sites, sampling, processing of samples and extraction of kimberlitic indicator minerals, as well as interpretation of results. IOS has not been involved in property acquisition process neither in property management.

The field work has been carried by author's employee under its supervision. The author did not visit the property itself, although he is very familiar with the area. Sample processing is currently carried under his supervision.

**PROPERTY DESCRIPTION**

The property is made of 295 contiguous map designated cell (30" long. X 30" lat.) for approximately 150 square kilometers (15,000 hectares). The property ownership is valid until December 2003 and renewable indefinitely. Assessment credits are currently available although not submitted.

The property is located in NTS-IV 33A-03 (Lac Autric), bounded by longitude 73°07' and 73°18'30" west and latitude

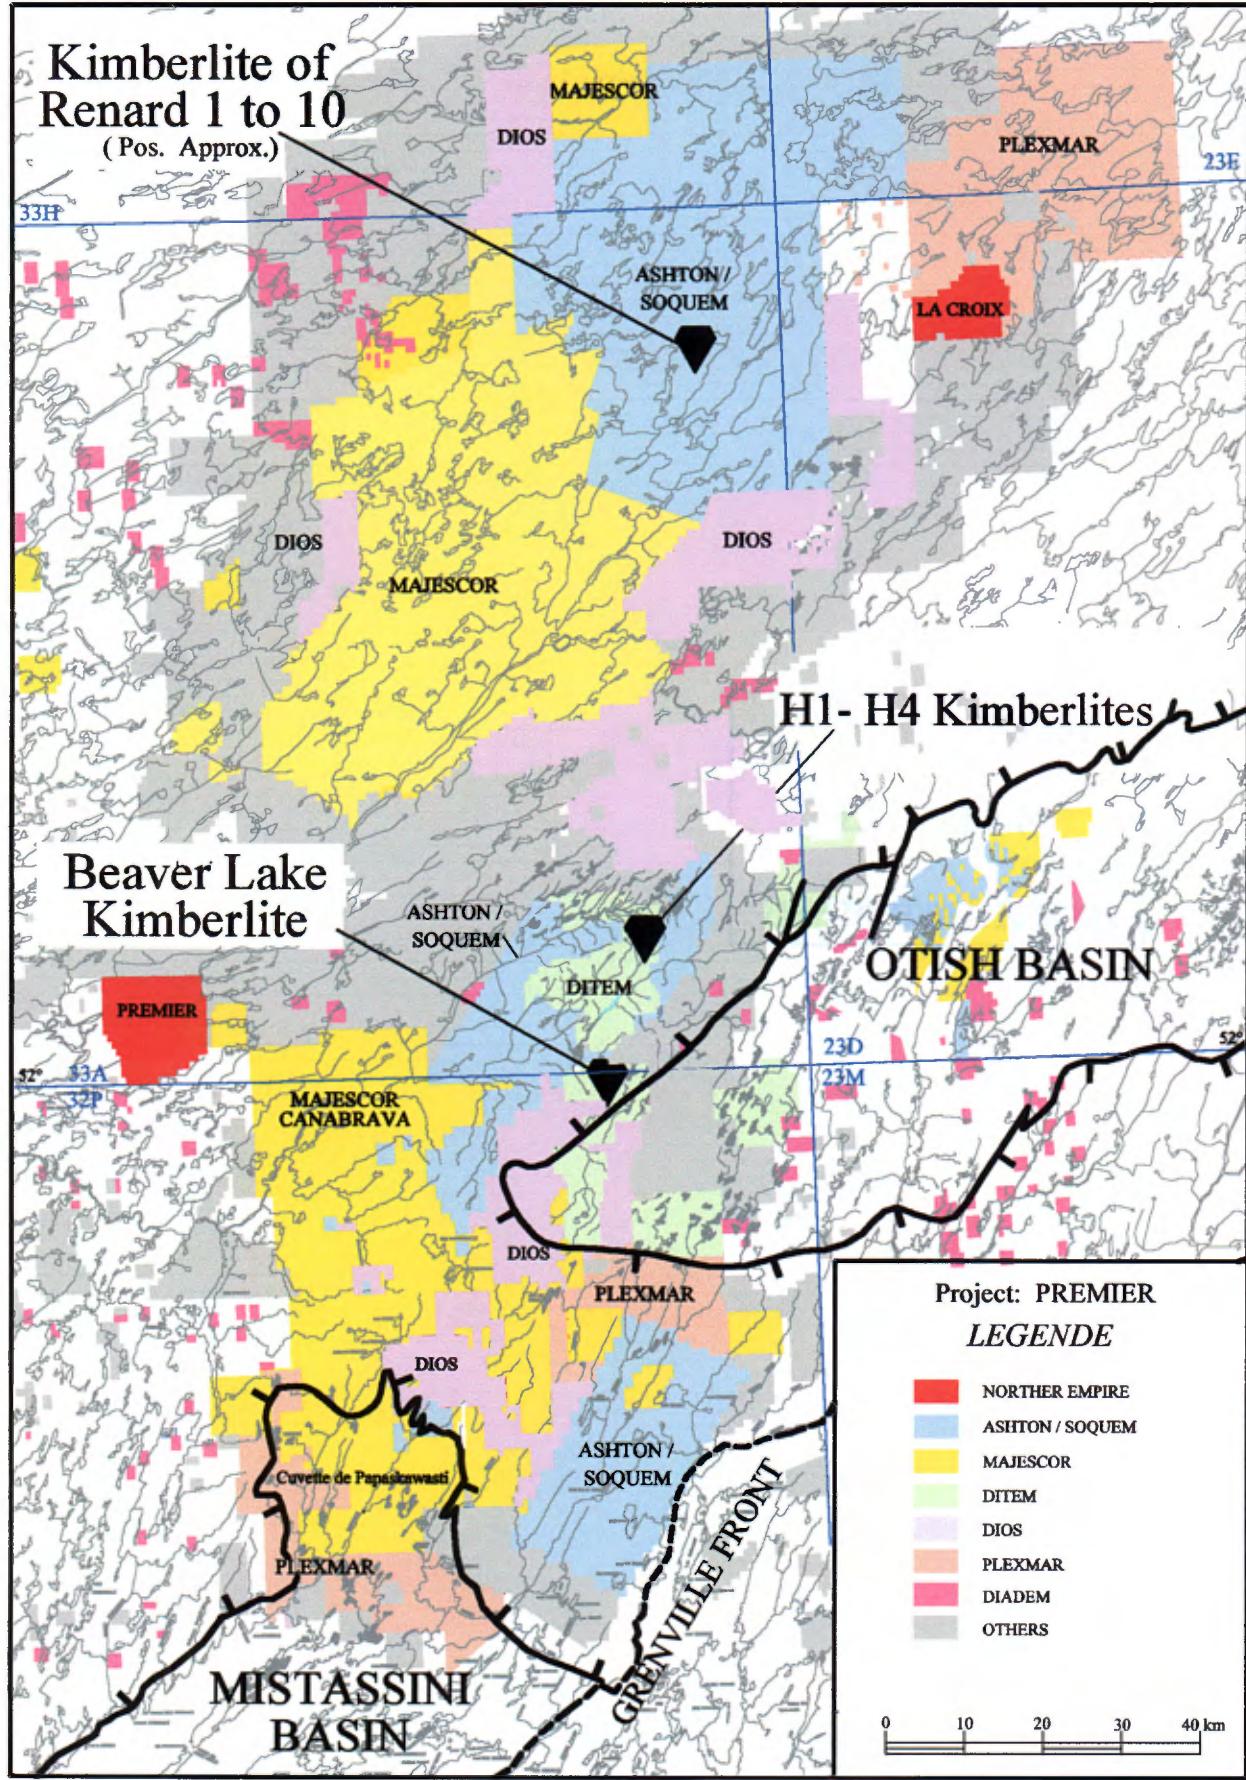

Figure 2: Adjacents properties and discoveries

## **TILL SAMPLING FOLLOW-UP PREMIER PROPERTY**

52°00' and 52°07'30" north. It is limited to the east by a property held by Ressources Majescor under option by Dunsmuir Ventures, and a small block held by Artik Geosciences, to the north-east by a block held by Mike Elson, to the north by a block held by Ressources Frenchies (Val d'Or prospectors), to the north-west by Ecstall Resources. Most of these properties are expected to expire next winter.

The property is included in Category III land by the James Bay Agreement, made between Quebec Government and Cree first nation. No restriction else than environmental regulation do restrict exploration and mining activities. Although located along the Eastmain river, the project do not seems affected by restriction due to hydraulic power.

The property is located about 240 kilometers from the mining town of Chibougamau, and 190 kilometers from the Mistissini Cree community. It is accessible by float-plane on the Eastmain river widening, or by helicopter. Remoteness require complex logistical support.

### **LOCAL GEOLOGY**

The property covers gneiss and granitoid belonging to the Opinaca sub-province of the Archean Superior province. A kilometric keel of amphibolite covers the northern third of the property, which is likely belonging to the Upper Eastmain river volcanic belt. The reader should be aware that a small gold mine (Eastmain mine, MSV Resources) has operated in this belt. However, no previous exploration work over the property is recorded in government's assessment files. Numerous small ultramafic bodies are reported scattered in the gneiss.

### **SAMPLING CAMPAIGN**

In 2002, a total of 39 samples were taken upon Premier property, which yield a 1 sample per 4 square kilometers density according to a quincunx pattern (**Map. 1**). Samples were ideally basal till plus a few esker material. However, du to local condition, many of the samples were fusion till.

The 2003 campaign included a total of 74 samples, of which 10 were in fill samples upon 2002 grid, and 64 were taken along closely spaced fences up-ice of 2002 anomalous sites. Samples were ideally spaced every 150 meters along fences, and fences spaced 500 meters apart. A long fence, with samples spaced every 250 meters, has been taken along the northern border of the property, up-ice of 2002 indicators.

## TILL SAMPLING FOLLOW-UP PREMIER PROPERTY

Table 1: Sampling pattern

Target	Indicator	Fences	Samples
4130036	1 G9 pyrope	3	18
4130029	2 G10-G1 pyropes	3	21
4130006	1 G10 pyrope	2	6
4130021	1 Picrolilmenite	1	4
4130026	1 picrolilmenite	1	4
4130035	1 picrolilmenite	1	4
4130008	1 Picrolilmenite	2	2
4130037	1 Cr-Diopside	1	4

Sampling has been carried on the 3<sup>rd</sup> to 5<sup>th</sup> of August 2003, by an IOS crew. The Hippocampe Lake exploration camp has been used as logistic platform. The crew was led by Alexandre Boudreault, ing, assisted by Patrice Gagnon P.Geo., plus Jonathan Lalancette, Steve Lavoie and Jean-Michel Belly, students. Logistic support included Yves Pépin, pilot and Norbert Bergeron, cook. Helicopter was a Eurocopter A-Star BA from Abitibi Helicopter. De Havilland DHC-3 sea-plane from Air-Saguenay was used for logistic, out of Rivière Témiscamie base. No fuel nor sample cache were required. Samples were taken out right away by IOS staff, and trucked to IOS facility in Chicoutimi. Daily log is provided in **appendix-1**.

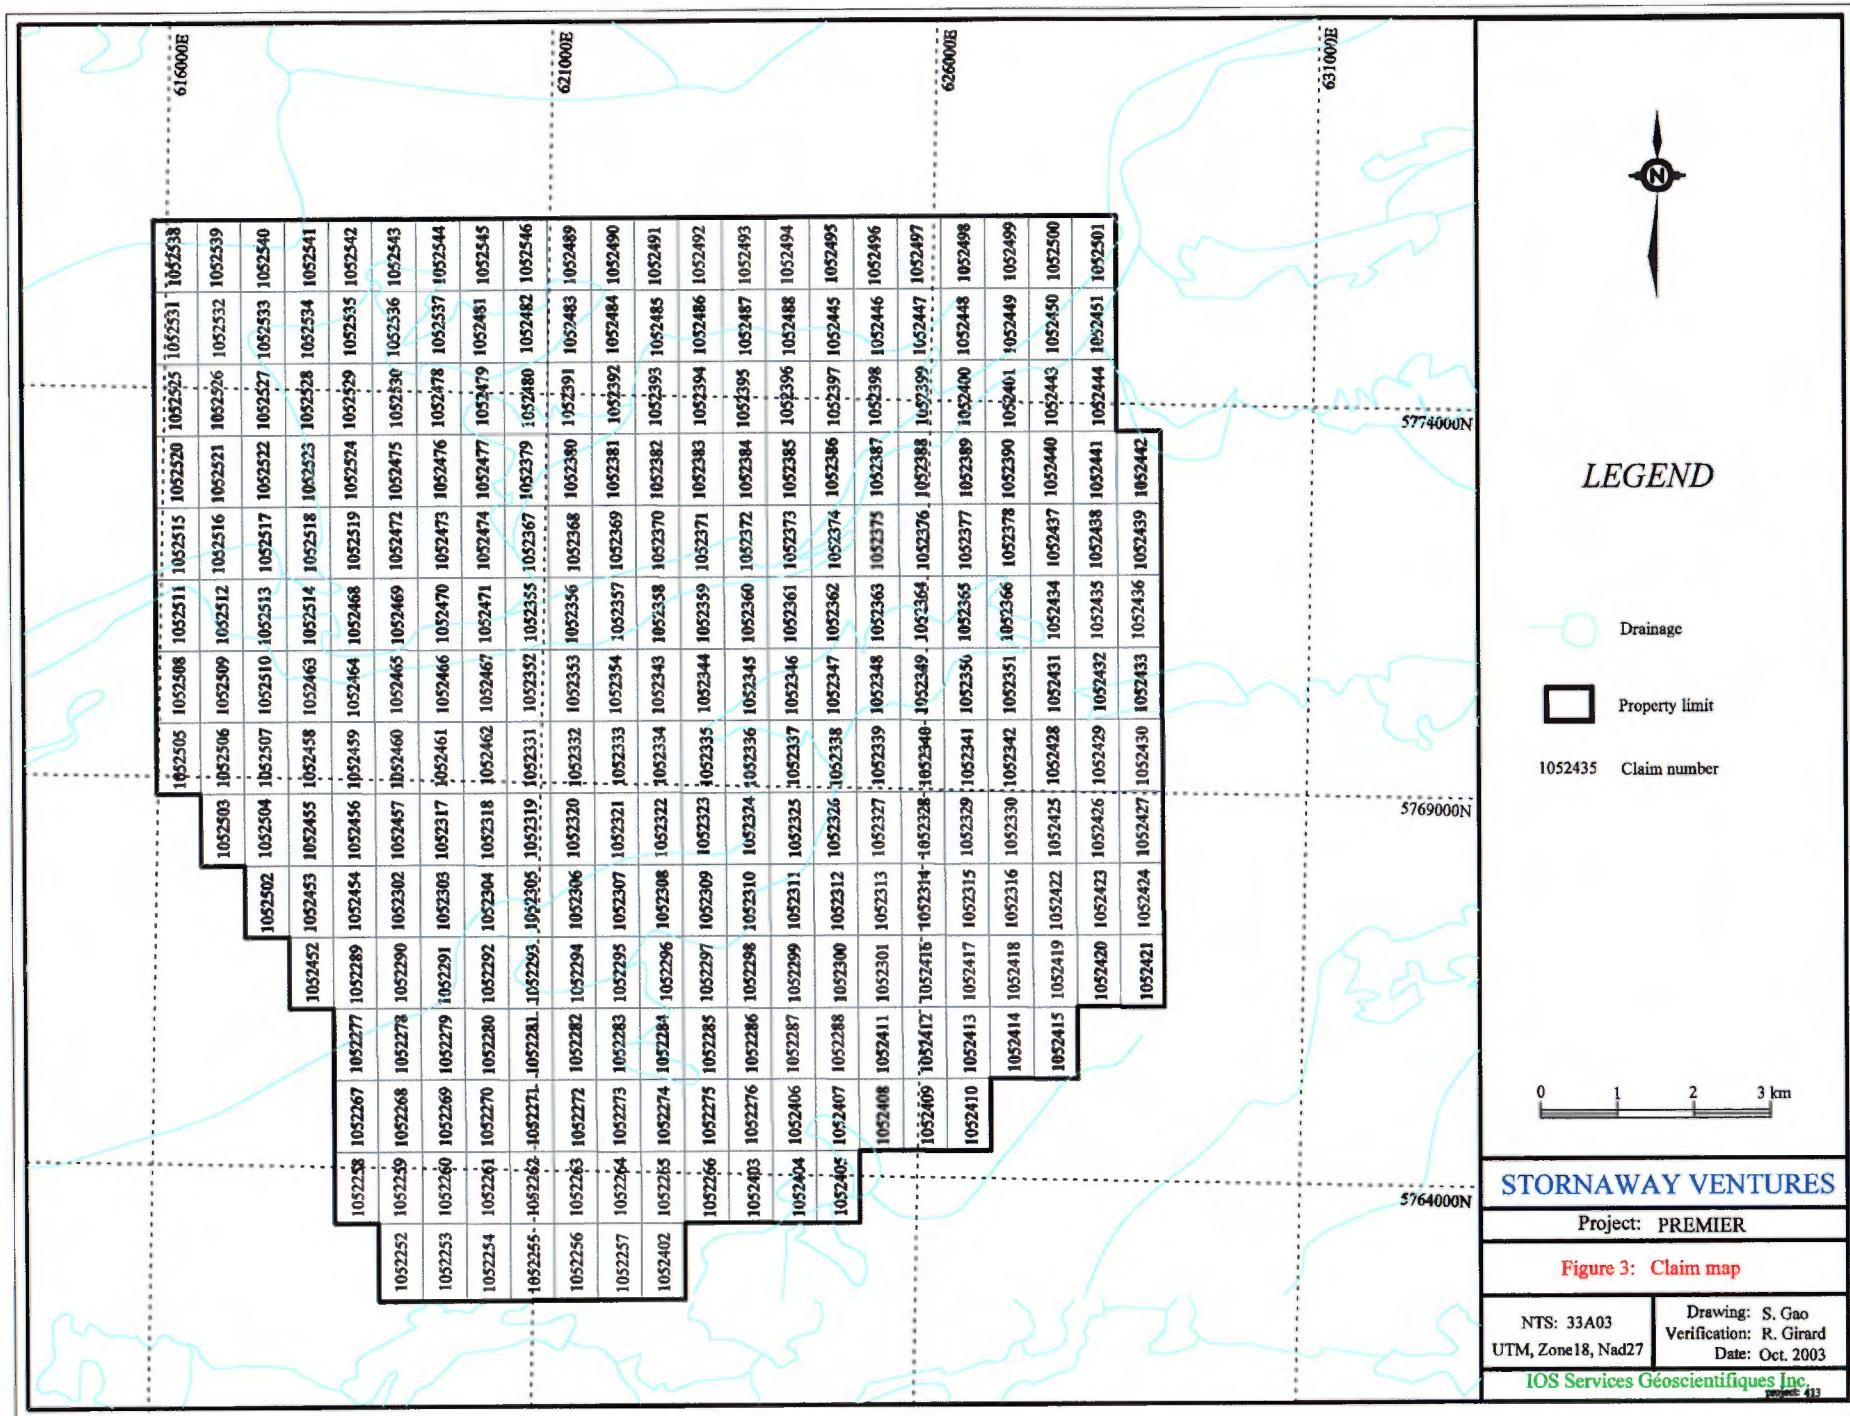

### SAMPLING PROTOCOLE

Sampling protocole is similar to 2002 campaign and has been carried by the same geologist. Sampling proceed by helicopter hop-frog dropping geologist one by one for regional in fill or by a ground crew for follow-up fences. Sampling site were pre-planned and stored in GPS, although final decision is taken by geologist acting as co-pilot according to local land morphology and landing site availability. Coordinate measurement is recorded with GPS by sampler. Sampling sites descriptions and localization is provided in **appendix-2**.

All samples were received at the laboratory in good standing and stored in queue for processing.

### **Till samples**

Final sampling site is selected by geologist in the field, in accordance with local topography, drainage and material availability. In numerous instances, many test holes needs to be dug prior to found suitable material.

## **TILL SAMPLING FOLLOW-UP PREMIER PROPERTY**

Sampling holes are dug by hand shovel and scaling bar to a depth below podzolized soil, usually about 1.5 meter. In most instances, fresh material from "C" horizon is taken. However the "B2" horizon (light brown material) is locally sampled if the soil structure is well developed and fresh material not obtainable. It was imperative that sample being taken below cemented ferricrust and below lag and deflation surface. Soil structure is described in term of horizon thickness and color. Boulders from lag deposits and cobbles from samples are described, as well as neighboring outcrop if present. Sampled material is described in terms of grain size distribution and constituent materials.

Sample, targeted as 25 kilograms, are taken with a shovel, removed of the most obvious cobbles, and bagged in a nylon bag plus a rice bag and sealed in the field. Samples tags and bags are prepared in advance. The number is written twice upon the bag, plus upon two plastic tag, and engraved on aluminum tag. The first plastic tag is attached at sampling site. The second plastic tag and the aluminum tag are introduced in the sample. An indexed spike, provided in vial, is introduced almost every samples. The sampling hole is not filled back.

Most samples were sandy ablation (or fusion) tills.

### ***Esker samples***

In a two instances, esker material has been sampled. Overall sampling procedure is identical with till sampling with the following differences. The esker is ideally sample at the crest, in a gravel horizon. Pebbles and cobbles are removed by hand. Material has not been sieved in the field, considering the small number of samples of such nature.

No stream nor black beach samples were collected.

### **SAMPLE PROCESSING**

Processing of the samples follow the standard procedure implemented in our laboratory and is near to identical to 2002 procedure, with the exception of tighter quality control. Detail laboratory procedure is available on request. Results of sample processing are presented in **appendix 3**, concatenated with 2002 results. Laboratory notes and processing sheets are available under request.

**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

***Wet sieving***

Samples were sieved by hand in the laboratory at 1000, 2000 and 9800 microns. A water spray on a standard 12" sieves mounted on top of a decanting tub has been used. Sand and silt is recovered by draining the tub and stored in pails until processing. Other fractions were drained and weighted (**appendix 3, table 1**) then discarded. Pebbles (>9.8 mm) were stored until a decision kept concerning counting.

If sample was cohesive due to clay, they are liquefied with the used of a drill mixer and added with calgon to free clay pellets.

A 300 grams aliquot of the received material was saved, dried and stored as reference.

***Pebbles counts***

No pebble count has been requested by client.

***Shaking table preconcentration***

The 0-1000 microns fraction has been processed on a shaking table. The model used is derived from a Wilfley table, with a custom built deck out of a Plexiglas sheet. The feed has been processed with multiple passes in order to recover an heavy mineral preconcentrate, a reject which has been discarded, and a meddling which has been stored until full processing is successfully completed with acceptable recovery (**appendix 3, table 2**). A 300 grams aliquots of the rejected mud has been dried and shipped for chemical analysis.

***Chemical analysis***

Mud recovered from Wilfley table has been dried and shipped to Chimitec (ALS Chemex) in Val d'Or for a multi-elements spectrometric analysis. Mud were digested in hot hydrochloric acid for a partial leach. Such digestion enable leaching of adsorbed ions and to dissolve ferrochelated material and sulfide minerals, without dissolving silicate minerals. Gold has not been assayed. Result is presented in **appendix 5a** and analysis certificate in **appendix 5b**.

**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

**Dry sieving**

The dried table preconcentrate has been sieved dry at 150 and 250 microns. The fines ( $0-150\mu$  and  $150-250\mu$ ) were stored while the 250-1000 microns fraction has been sent to acid wash (**appendix 3, table 2**).

**Acid wash**

The  $250-1000\mu$  preconcentrate has been soaked for about 8 hours in oxalic acid solution (20g/l for each 250 grams of mineral) in order to remove the ferric coating upon the grains. No corrosion is usually observed upon sulfides mineral nor upon silicates (**appendix 3, table 3**).

**Heavy liquids**

Clean preconcentrate has been submitted to heavy liquid in Chimitec facilities in Val d'or. Methylene Iodide has been used with a density of 3.3 g/cc. Heavy mineral concentrates are washed in acetone, dried and returned to our facilities. Lights minerals are stored for 3 months in Chimitec facilities and discarded upon successful completion of the processing (**appendix 3, table 4**).

**Hand magnet separation**

Magnetite and other ferromagnetic mineral are removed from the concentrate with an hand magnet (**appendix 3, table 4**). Lot of care is apply to this step since any trace of magnetite will tend to clog the Frantz separator. Magnetite is stored in case visual examination is needed.

**Frantz magnetic separation**

The non-ferromagnetic heavy minerals were then split into various fractions based on their apparent magnetic susceptibility with a Frantz field barrier magnetic separator. Forward and slope angles were set at  $15^\circ$ , and passes done at diverse currents (**appendix 3, table 5**).

**Visual examination**

Visual examination of the concentrate was carried under a polarizing stereomicroscope by geologists or mineral

## TILL SAMPLING FOLLOW-UP PREMIER PROPERTY

technician, Mme Natacha Fournier, Sanmei Gao and Renée Rossignol. Selected minerals were extracted and stored in specially designed board.

Results of visual examination are presented in **appendix 4**. Proportion of constituent minerals is provided in **table 1**, while a list of extracted mineral is provided in **table 2** and visual KIM counts in **table 3**.

### **Mineral mounting and microprobe analysis**

Grains selected by the mineralogist were reexamined by Mme Lucie Tremblay, P. Geol. In last year (2002) program, significant grains were shipped to Barnett Geological consulting for microprobe analysis (**appendix 5a**). Microprobe results were provided back to IOS (**Appendix 5b**) by Northern Empire Minerals. No indication concerning microprobe setting is available to the author. Only kimberlitic indicators were analyzed, such as pyropes and magnesium bearing ilmenite. Most of the minerals were tested with EDS prior to full WDS analysis. Diopsides are exception, the majority of the grains provided have been analyzed.

Microprobe analysis for 2003 samples has been carried by IOS. Significant grains are mounted upon a glued glass plate, indexed and molded into epoxy. The epoxy bead is then engraved, polished to  $0.2\mu$  and carbon-coated for microprobe analysis.

### **Scanning electron microscope**

Grains of dubious visual identification or unfamiliar to the mineralogist are submitted for examination with a scanning electron microscope (SEM). A qualitative chemical characterization is made using an energy dispersive system (EDS). The Jeol 820A microscope from the "Laboratoire de microanalyse de l'Université Laval" is used, which is equipped with a Northern-Tracor EDS analyzer. The x-ray spectrum is visually interpreted by the author to evaluate the chemical proportion and to interpret mineral species. Results are presented in **Appendix 3**.

### **Microprobe analysis**

Microprobe analyses were carried out using the 1998 Cameca SX-100 electron microprobe based at the *Laboratoire de*

## TILL SAMPLING FOLLOW-UP PREMIER PROPERTY

*microanalyse de l'Université Laval.* This machine is Sun-based and equipped with five variable multi-crystal wave-length dispersion spectrometers (WDS), EDS analyzer, cold plate, imaging facilities, etc. Analytical routine for indicator minerals was established four years ago by IOS. Settings and detailed procedures are provided in **Appendix 4, Table 1.**

Calibration is performed upon pure oxides, and checked with standard minerals. Different calculation routines (labels) are available for garnet, pyroxene, ilmenite, olivine and spinel stoichiometry. The ferric-ferrous iron ratio is calculated by Cameca software according to labeled stoichiometry.

Olivine were checked with EDS-SEM solely and not mounted for microprobe analysis. Chromite were confused with ilmenite in course of visual identification, and thus analyzed using ilmenite calibration. The stoichiometry and iron partitioning recalculated by the author.

Microprobe analysis certificates (microprobe print-out) are provided in **Appendix 4, Table 2.** Recast and indexed analyses are listed in **Appendix 4, Table 3,** along with mineral interpretation.

Minerals are typically analyzed near their core, as far away as possible from cracks, inclusions, exsolutions and alteration. Rare reaction rims were noted upon ilmenite, only two of such were analyzed.

### QUALITY CONTROL

#### *Spiking*

Near to all samples were doped in the field with brass chips. These spikes are indexed and designed to be recovered by the picker. This provide a control on the overall recovery of the process, to ensure that no material is loss through accident and to detect any cross-contamination, sample switching or mislabeling. A total of 410 chips were introduced in 2003 samples, of which 399 were recovered for 97% (118 over 124 in 2002 for 95%). Average 2003 recovery is above 97%. Result are provided in **appendix 6.**

#### *Metallurgical balance*

Achieving a good and regular recovery on a shaking table is notoriously tricky and needs to be constantly monitored. This recovery is dependent upon grain size, mineral shape and

**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

density contrast. Typically, recovery decrease with coarseness, from about 95% at 0.25 mm to 90% at 0.5 mm to 70% at 1 mm for garnet. Stubby mineral such as garnet typically shows a good recovery, which decrease for prismatic mineral such as hornblende and drastically drop for platy minerals such as mica.

To monitor recovery rates by mineral species, a metallurgical balance is carried every 10 samples in average, 4 out of 39 samples for this project. For such, table rejects are dried, split into a 250 grams aliquot, sieved at 250 $\mu$  and separated with heavy liquids. Common garnet, hornblende and magnetite abundance are visually estimated. Proportion are then calculated back. Tolerated threshold are 95% for oxide, 90% for garnet and 75% for hornblende, while lowest recoveries were respectively 96,73%, 94,31% and 77,37%.

***Cross-picking***

Quality of mineral sorting is controlled through cross-examination of the 0.4 amps paramagnetic fraction. No sorting problems were identified within this project.

***Microprobe analysis***

Quality of microprobe results are controlled through closure tolerance (98%-102%), stoichiometric balance (0.1 cations) and trend fitting. Stoichiometric imbalance indicates inter-elements discrepancies, typically due to single spectrometer drift or calibration misfit. Closure misfit in absence of stoichiometric imbalance is indicative of current drift, carbon coating irregularities or stage Z axis focus misalignment. Since calibration is carried upon pure oxides, intrinsic closure induced by improper standard are unlikely. Stoichiometric imbalances are complex to interpret and dependant upon mineral species. They are sensitive to iron valence allocation, which may induce intrinsic balancing. Finally, in rare instances, intrinsically closed and balanced analysis are detected in course of interpretation through typical trend misfit. Analysis quality control test are hidden in the microprobe database.

No significant closure discrepancies nor stoichiometric imbalanced exceeding tolerance limits were detected in this analytical batch.

**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

**CHEMISTRY OF THE MINERALS**

A total of 9 kimberlitic indicator minerals with good chemical signature were located in 2002 survey over Premier property. All these individual samples prompted a follow-up sampling program, which yielded 24 dependable indicator minerals. Such counts are not comparable with typical results from Northwest Territories, but do deserves attention in the actual setting. These are summarized in table 1.

*TABLE 1: Indicator mineral*

Sample	Pyrope	Ilmenite	Dioside	Chromite	Total
4130006	1				1
4130008		1			1
4130021		1			1
4130026		1			1

4130133		1			1
4130135			1		1
4130140		1			1
Total	6	19	6	3	34

For sake of simplicity, all mineral analyzed in 2002 and 2003 were interpreted together.

**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

**Garnet**

A total of 68 garnets were analyzed in 2003, of which only 40 were manganese bearing and definitely not of mantellic origin. According to Dawson and Stephen cluster analysis, the non-manganese garnets are grouped as follow:

		2002	2003	Meaningfulness
G1	Low-Cr Megacryst	1	1	Medium
G2	High Ti Megacryst	0	1	Medium
G5	Almandine	0	2	Low
G7	Ouvarovite	1	0	Low
G8	Grossular	1	24	None
G9	Pyrope	1	0	High
G10	Knorringite	2	0	Very high

In the ternary diagram of aluminous end-member (*figure 4*), the garnets plots close to pyrope, almandine or grossular pole. No intermediate composition typical of eclogitic garnet is present. Pyropes fall in a tight cluster, the position of which is typical of kimberlitic signature. Consider this diagram do take account of aluminous end-member excluding all spessartine bearing analysis, and filters the effect of uvarovite and knorringite end-members.

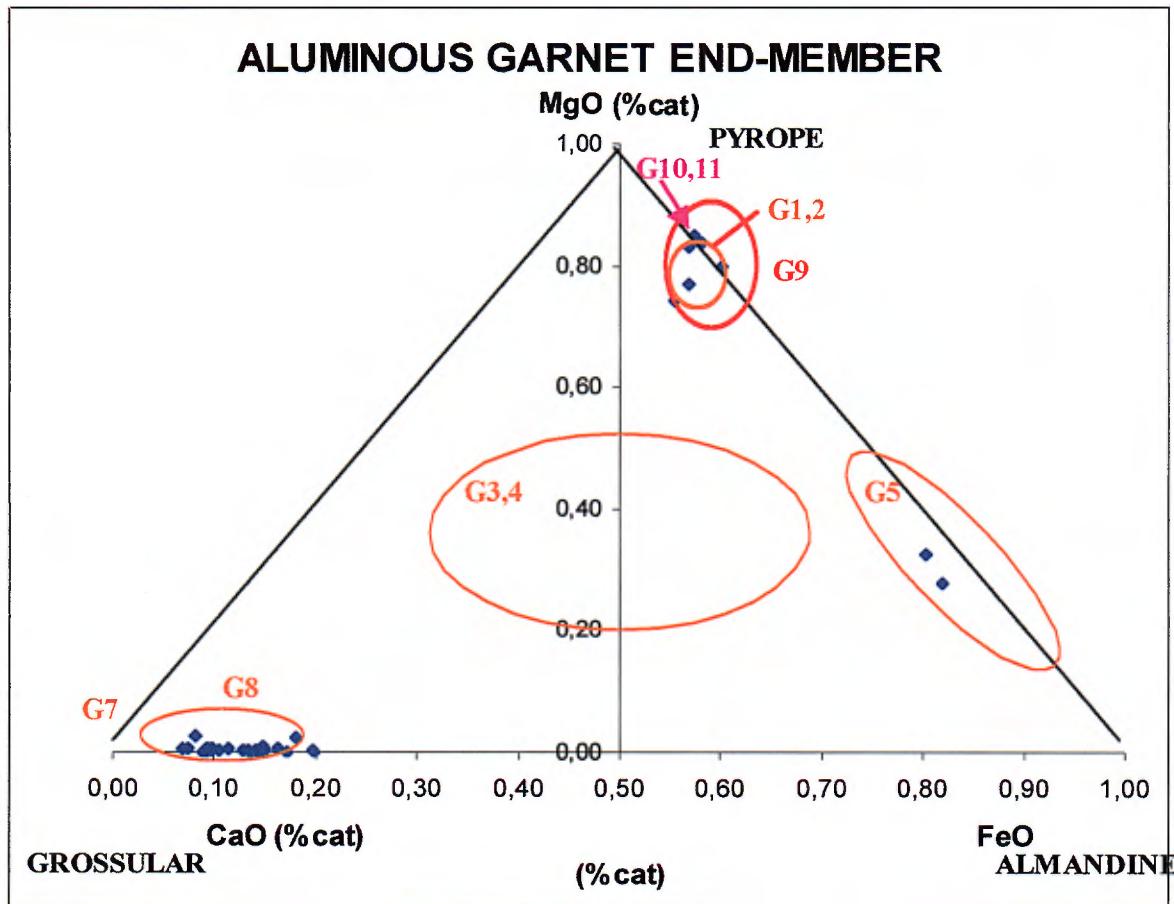

Figure 4: Ternary diagram for aluminous garnet end-member. Note that no eclogitic garnet (G3 and G4) are present. Data filtered at <1% MnO.

In the industry standard diagram of Gurney et al., opposing chromium and lime content, the pyropic garnet plots dominantly in the lherzolitic calcic pyrope (figure 5). Note the few low-chromium megacryst. On garnet, from sample 4130029 falls well inside the harzburgitic field, above the diamond exclusivity boundary (Grütter, 2003). This grain, indicating that the diamond stability field has been tap by a kimberlitic source, is highly significant. The average J-factor is of 1.83 (Lee 1993).

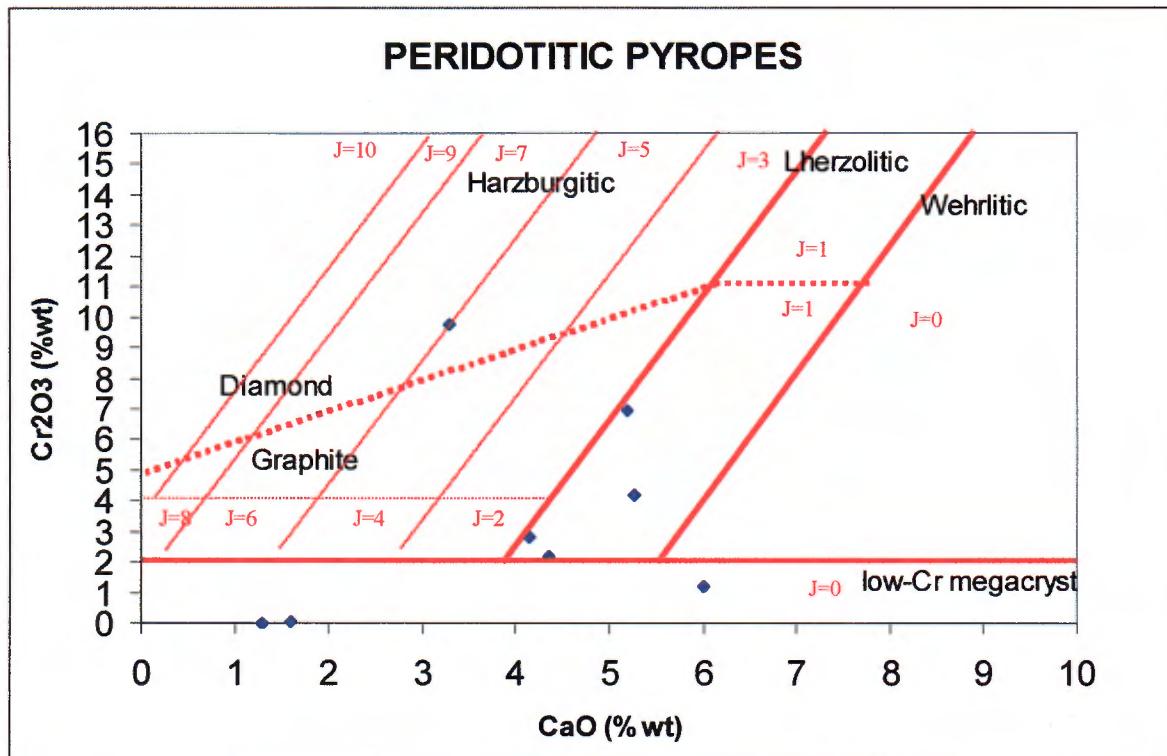

Figure 5: Gurney's diagram for peridotitic pyrope. Note the harzburgitic grain from sample 4130029, which has 7 on  $J$ -score (Lee, 1993). The diamond exclusive field is from Grütter 2003.

On the Schultz diagram for eclogitic garnet (figure 6), opposing titanium and sodium, all suitable garnets fall along the typical low-Cr megacryst trend. Remember that 2002 analysis do not have sodium values. Data were filtered at <1%  $\text{MnO}$ , <22%  $\text{FeO}$ , <20%  $\text{CaO}$  and 4%  $\text{Cr}_2\text{O}_3$ .

Detrital pyropes are found throughout the area in low abundance. High chromium harzburgitic pyropes, such as in sample 4130029, are accounting for 30% of total pyropes in the Renard cluster and Portage dispersion train, to the north of Premier. They are less abundant in the surrounding of Permier, and practically absent from Beaver Lake kimberlite. The Beaver lake area is characterized by a small population of low-chromium harzburgitic pyrope. Harzburgitic pyrope are very rare further south. All pyrope population are dominated by lherzolitic pyrope, the maximum chromium content decreasing from Renard-Portage southward. Similarly, low-chromium megacrysts are seldom in Renard-Portage, and make up to 50% of detrital pyropes close to lake Mistassini. No

eclogitic garnet are reported yet in the area<sup>1</sup>. Garnets found in Premier property share similarities with Beaver Lake signature, with the exception of the high-chromium harzburgitic knorringite of sample 4130029.

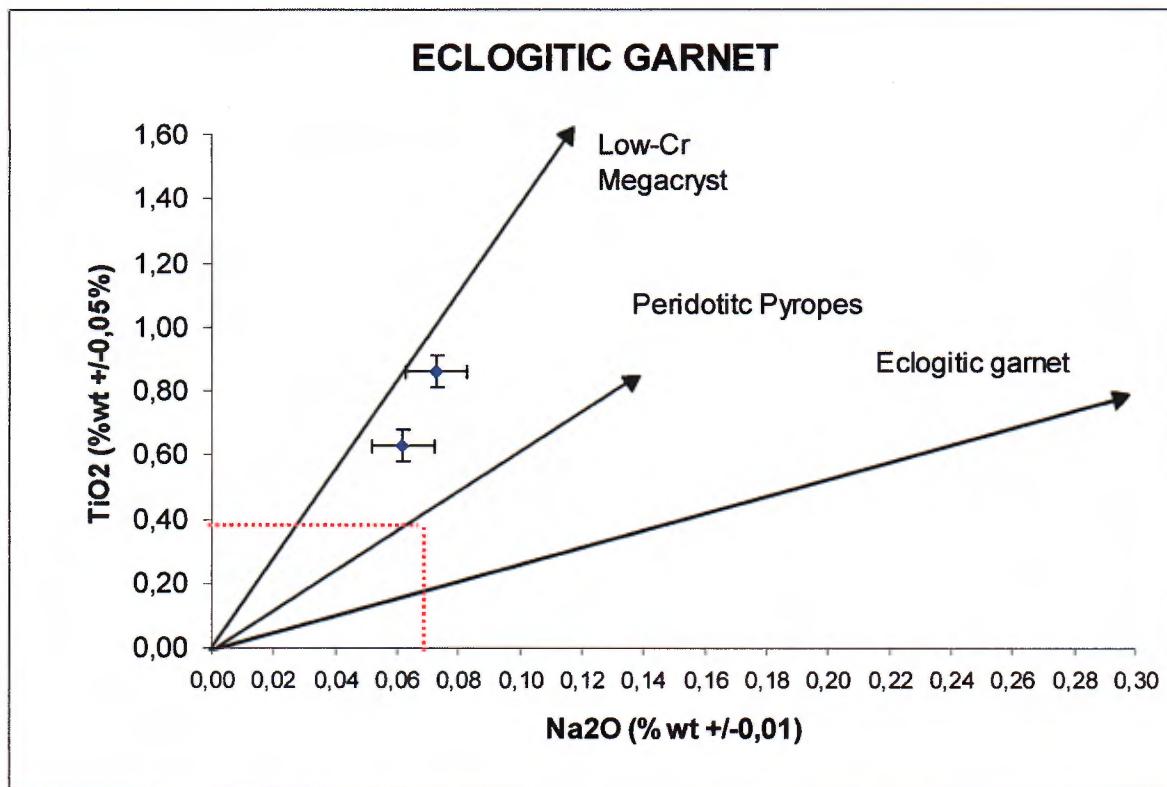

Figure 6: Schultz's diagram, modified by the author, for eclogitic garnet. Only the two low-chromium megacryst analysis qualify for this diagram, and fall along the LCM trend.

### **Pyroxene**

Pyroxene is a difficult mineral to interpret as kimberlitic indicator. Although assumed that the vivid green color being distinctive, it's chemical characterization can be tricky. Furthermore, not all kimberlitic pyroxene megacryst are vivid green. Therefore, many dull green pyroxene were extracted and analyzed. If excluding the eclogitic omphazite, most kimberlitic pyroxene are diopside,

with MG# greater than 85%. They shall plot close to the diopside pole on the ternary end-member diagram (**figure 7**).

---

<sup>1</sup> Eclogitic garnet and diopside reported by Melkior Resources are likely crustal garnets.

TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY

In the current project, all pyroxene plot close to the diopside pole. Two populations are noted, which carries in every diagrams. All grains with MG# > 0.85 are salite and diopside ss., while grains with MG# < 0.85 are dominantly diopsidic augite. Two salite are hypercalcic or oversaturated in wollastonite molecule.

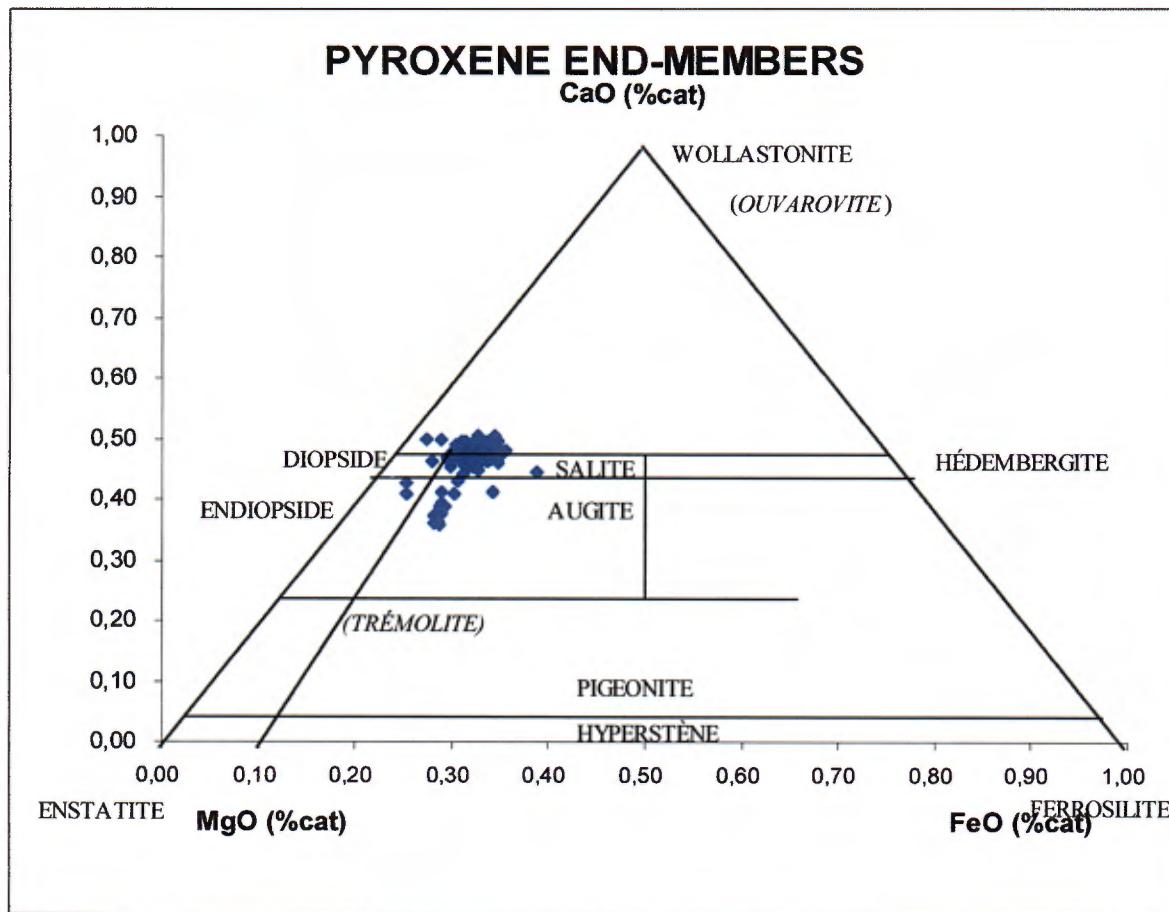

Figure 7. End-member ternary diagram for pyroxene. All analysis fall close to the diopside pole, either as salite or diopsidic augite. Notice two diopside ss. analysis oversaturated in wollastonite.

Trace elements are currently used to filter mantellitic pyroxene from ones of regional origin. Sodium and chromium are typically present in kimberlitic pyroxene in level above 0.8% (figure 8). Potassium can be present in eclogitic pyroxene, while titanium is indicative of alkalic sources.

Two populations are discernable. A low-chromium and moderate sodium population correspond to salite, while a moderate chromium and low sodium population correspond to

TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY

diopsidic augite. These two populations are ubiquitous in the area and interpreted as regional diopside. A few analysis stands above the 0.8% Na<sub>2</sub>O threshold, corresponding to endiopside and diopside *ss*.

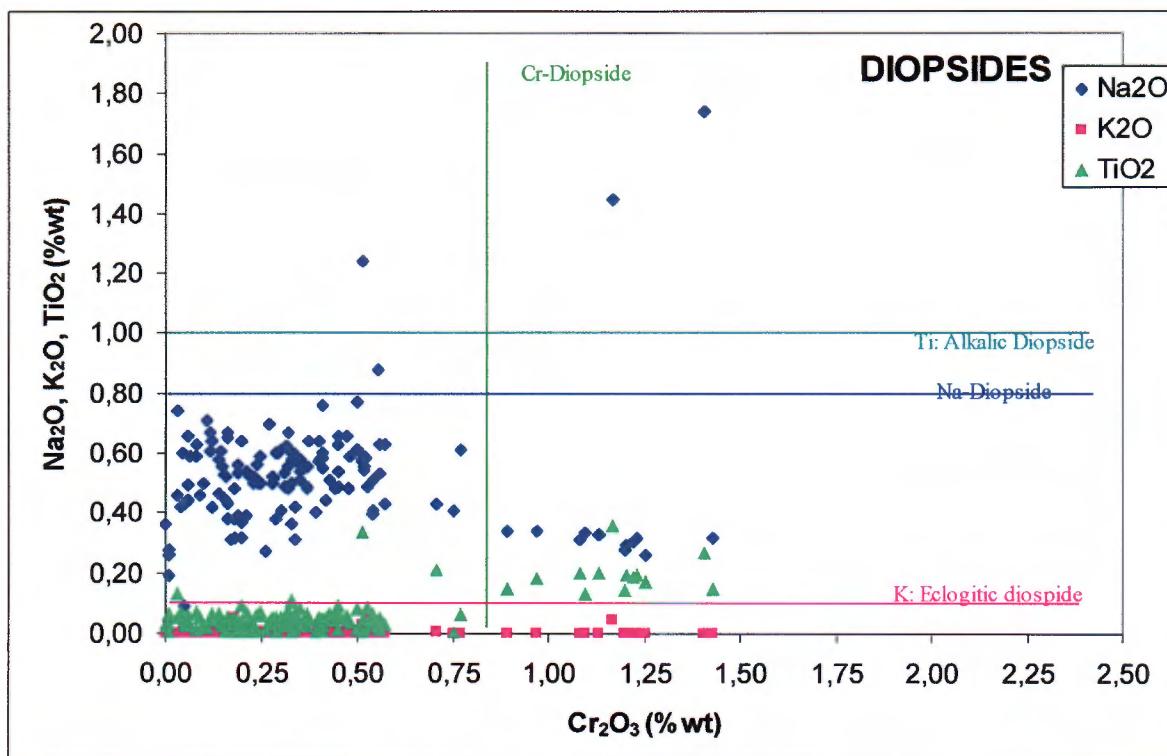

Figure 8: Minor elements in diopside. Note the two main population corresponding to salite and diopsidic augite, and the four analysis enriched in sodium.

Incorporation of minor elements in pyroxene is linked with a few diadochic substitution, to generate minor molecules. Sodium is introduced according to  $\text{Na}^{\text{M}^{++}} \leftrightarrow 2\text{M}^{++}$  in octahedral coordination. The trivalent cation can be Al<sup>+++</sup> in the jadeite molecule, Cr<sup>+++</sup> in kosmochlor and Fe<sup>+++</sup> in acmite . Excess of M<sup>+++</sup> is allocated as Tshermack substitution, in octahedral and tetrahedral coordination. Deficiency of trivalent cation is compensated by allocating iron to ferric state. Stoichiometric calculation allows for these molecules.

Kosmochlor molecule is typically introduced under high pressure condition and chromium availability, such as in peridotitic mantle. Jadeite molecule is typically introduced under high pressure and aluminum availability, such as in eclogitic mantle and to a lesser extent in peridotitic mantle. Tshermack substitution is more typical of lower

pressure condition, while acmite is indicative of low silica activity and oxydizing conditions, such as in alkalic magmas. Typically, diopside macrocryst in kimberlite are enriched in jadeite and kosmochlor molecules. These can be visualized in the classical Sobolev diagram (figure 9), opposing the sum of octahedric aluminium and chromium, versus sodium, with a 1:1 ratio. A lower ratio indicates presence of Tshermack molecule, while higher ratio indicate acmite molecule. This diagram is powerful in outlining most significant macrocrystic pyroxene, but fail to outline all varieties of kimberlitic pyroxene. Three jadeite-kosmochlor diopside are retained, from samples 4130101, 4130122, 4130135, plus one enriched in jadeite and Al-Tshermack typical of spinel peridotite or eclogite in sample 4130095. All these are positive kimberlitic indicator minerals.

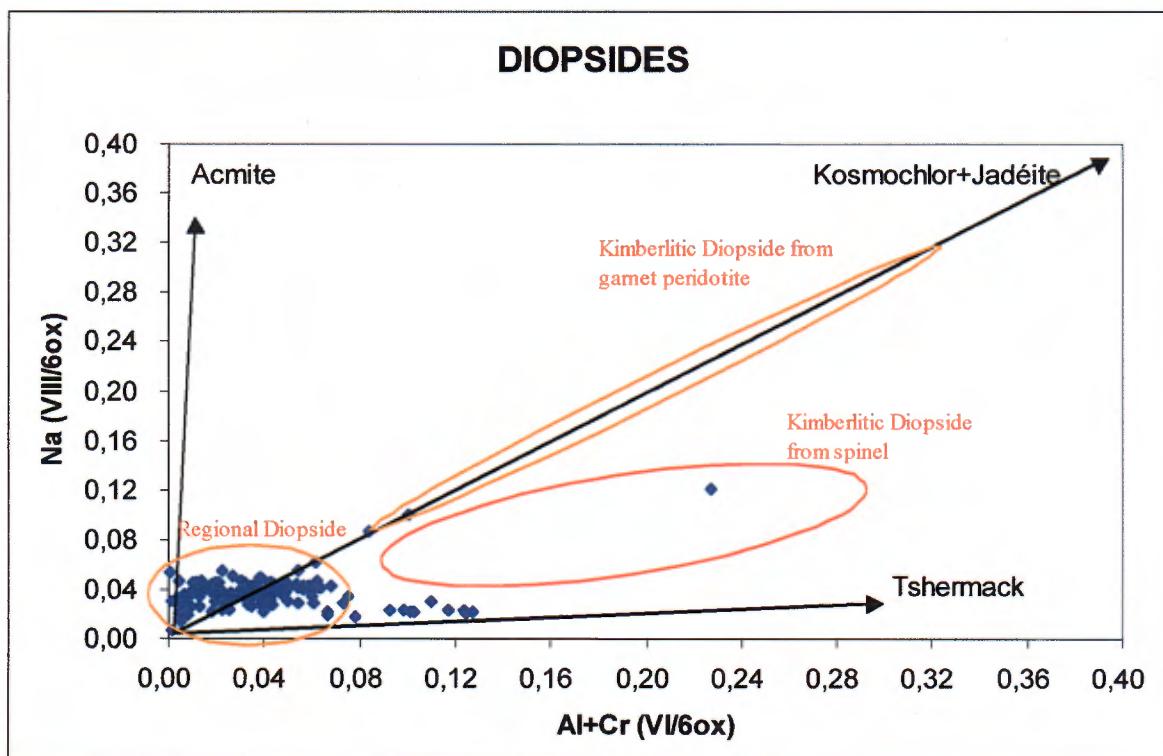

Figure 9: Sobolev diagram for diopside discriminating kimberlitic macrocryst on the basis of sodic end-member. Note that four analysis plot along the 1:1 ratio indicative of kosmochlor-jadeite substitution, plus one also including a Tshermack molecule component.

Numerous other discrimination diagrams are available for diopside, although none is fully reliable. The Morris et al (2000) diagram (figure 10a) use a minor molecule ternary plot and the companion Crabtree (2003) diagram (figure 10b) use Ca# and sodium. Both diagrams outstand the same sodium-rich

TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY

analysis as potential kimberlitic indicator. The salite and diopsidic augite population are clearly distinctive.

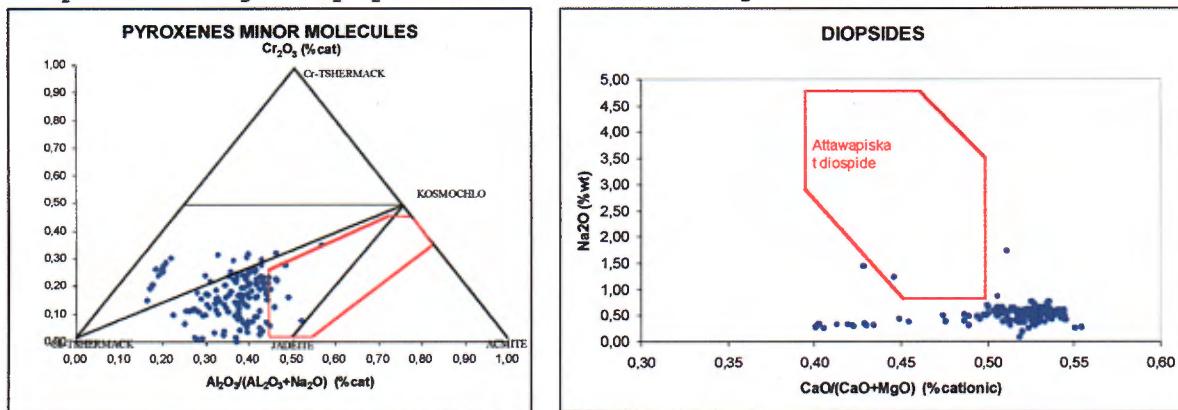

Figure 10: Morris (2000) and Crabtree (2003) diagram for diopside discriminating kimberlitic from regional diopsides. Note the salite and diopsidic augite population and the few outlying analysis falling close to the kimberlitic field.

Detrital kimberlitic diopside are seldom in the area, both in the Renard-Portage area and the Mistassini-Papaskwasati area. Diopside is absent from the Beaver Lake kimberlite and has not been noticed by the author in other kimberlite core from the area. The rares kimberlitic diopside known from the author have a chemical signature similar to the one found in the Premier property. Thermobarometric calculation were not carried.

### **Chromite**

Three grains of chromite were analyzed along with ilmenites. Two of these chromites, from samples 4130080 and 4130132, have very high chromium content, about 64%, which makes them similar to chromite found as inclusion in diamond. On the classical  $MgO-Cr_2O_3$  and  $TiO_2-Cr_2O_3$  plots (figure 11 & 12), these are projected directly in the DI-chromite field.

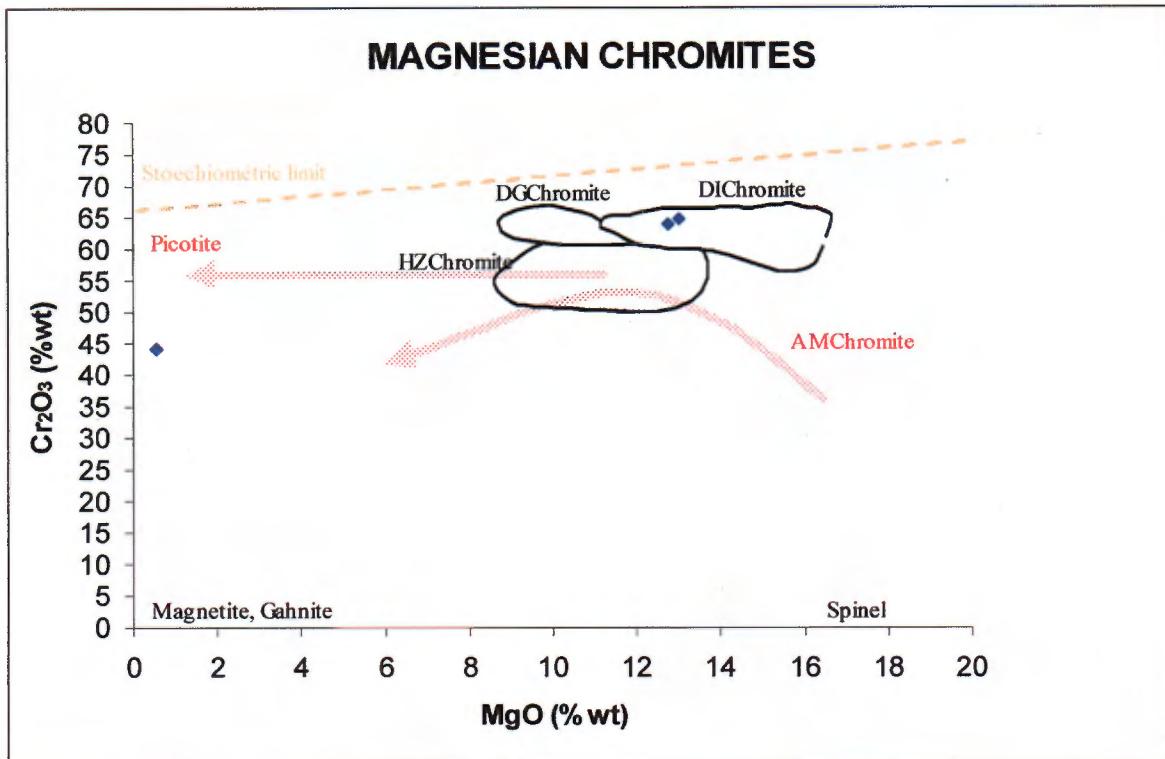

Figure 11: Industry standard diagram to discriminant kimberlitic chromite. DI and DG chromite field are from Fipke et al. 1993, other items are from the author. Note the two DIChromites.

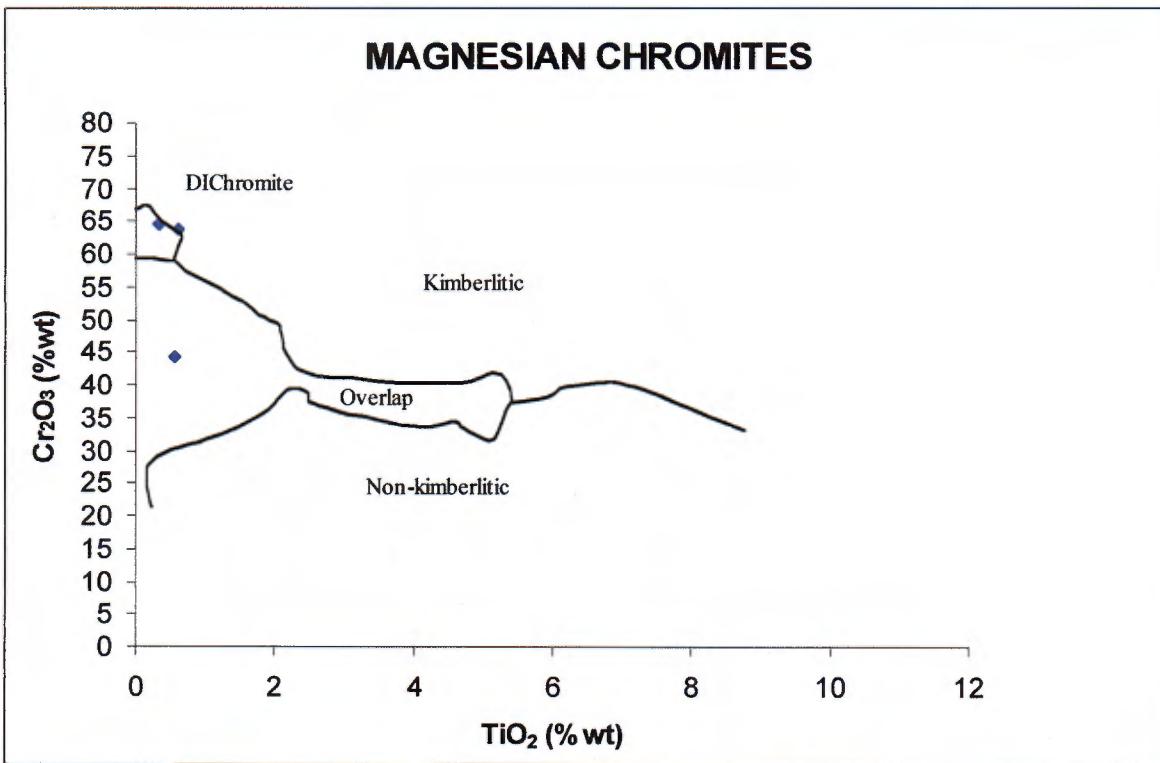

Figure 12: Discriminant diagram for chromite based upon titanium content (Fipke 19xxx). Both DI-Chromite are properly located in low-titanium range.

The third chromite, from sample 4130094 is a ferrochromite, with medium level of chromium and almost devoid of magnesium. Its origin can be kimberlitic as well as crustal. Lumps of peridotite are reported here and there in the area, which could act as source rock.

Kimberlitic chromite are rare in the Portage and Renard area north of Premier, as well as in Beaver lake intrusion. Further south in the Mistassini-Papaskwasati dispersion train, kimberlitic chromites are not abundant although ubiquitous.

### **Ilmenite**

From the ilmenites analyzed, a total of 19 have a chemical signature of kimberlitic ilmenite macrocryst. Three grains were analyzed both at core and rim. In ternary plots of end-member molecules, kimberlitic macrocryst nicely discriminate from regional ilmenites (figure 13). In the hematite-ilmenite-geikielite ternary diagram (Haggerty,

TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY

undated), the magnesian ilmenite neatly fit the kimberlitic trend at low  $F_{O_2}$ .

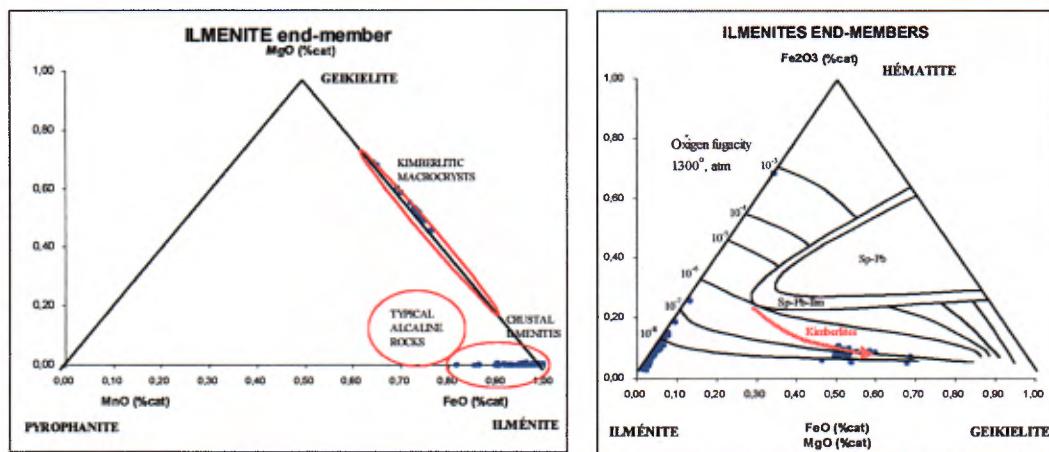

Figure 13: Ilmenite composition in term of end-members. Note the distinctiveness of kimberlitic geikielite.

The magnesium content of the present kimberlitic ilmenite is narrowly constrained, between 12% to 15% MgO, with a few analysis with higher content. No ilmenite falls in the 4-12% MgO, which is quite a distinctive feature of this population. Two analysis are above 18% MgO, both from rims of grains. These ilmenites are low in chromium, in spite of their high magnesium. In the industry standard plot of magnesium against chromium (figure 14), they form a two tight cluster at 1.8% and 0.8%  $Cr_2O_3$ , which is not very typical. Some people would interpret such analysis as indicative of prevailing low oxygen fugacity in the magma, preventing diamond dissolution by the magma. This corroborate the low hematite content of the ilmenite. The two rim analysis are very rich in magnesium, up to 18% MgO, but proportionally low in chromium.

In the titanium against magnesium diagram (figure 15), which is gaining acceptance in the industry, the picroilmenite fall well inside the kimberlitic field, along the 20%  $Fe_2O_3/FeO_{total}$  isopleth.

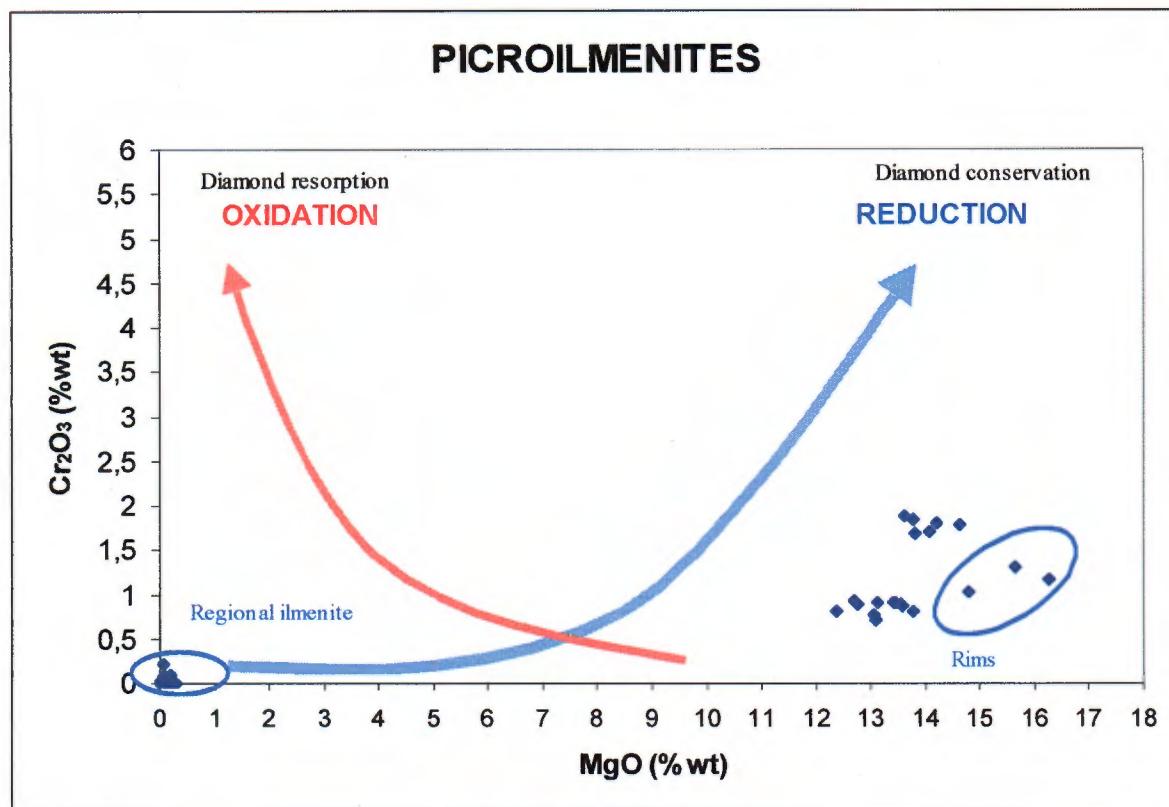

Figure 14: Industry standard diagram for ilmenite. Notice the two clusters of magnesium bearing ilmenite, and the rim analysis even richer in magnesium.

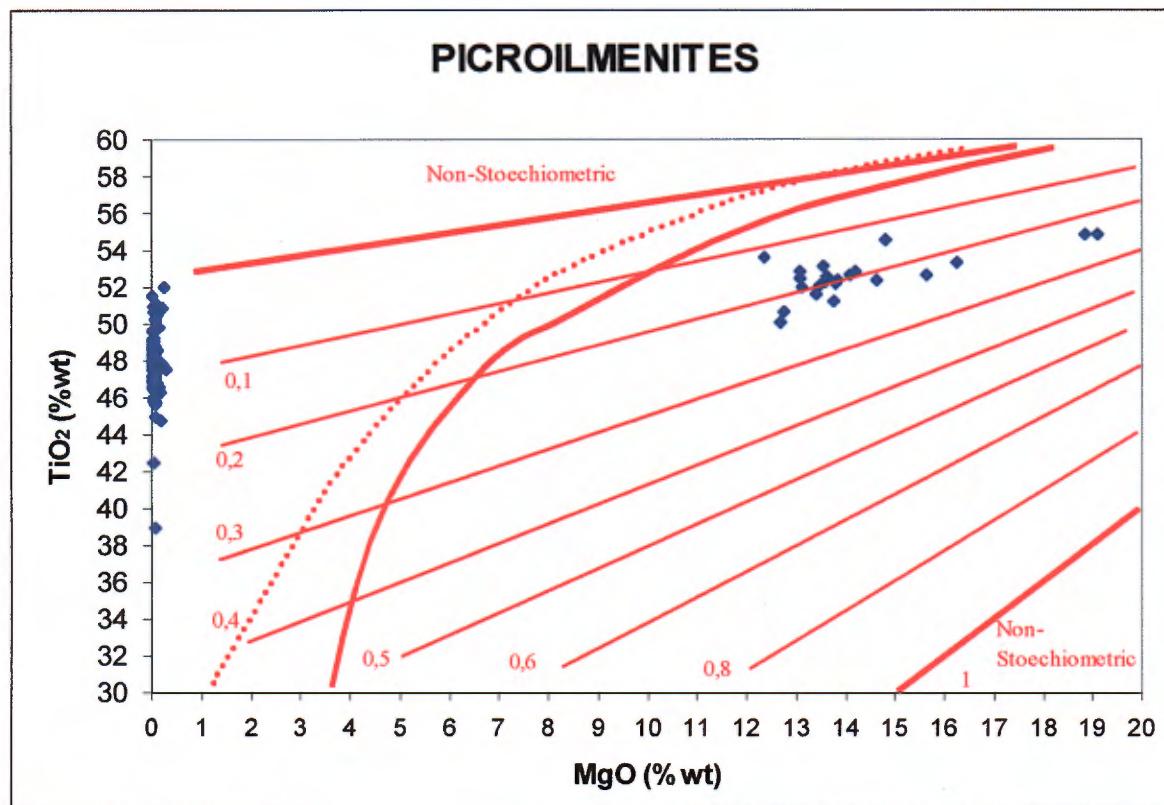

Figure 15: Titanium-magnesium diagram, indicating the constant oxidation level of iron in the ilmenite, which plot along the 20% isopleth.

The chemical signature of the ilmenite from Premier is peculiar compare to other source in the area. Its show similarity with Renard-Portage signature in term of magnesium content and ilmenite abundance, but do lack the high chromium grains. It is distinctively richer in magnesium than Beaver lake ilmenite. It lack the scattering in magnesium and chromium of ilmenite from Mistassini-Papaskwasati dispersion train. Finally, the ilmenite-pyrope ratio is higher than in Portage-Renard area, but much lower than in the Mistassini-Papaskwasati area.

#### Olivine

A few olivine were confirmed by the EDS-SEM, but were not analyzed with microprobe. These are forsteritic in composition, but their kimberlitic nature can not be confirmed.

TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY

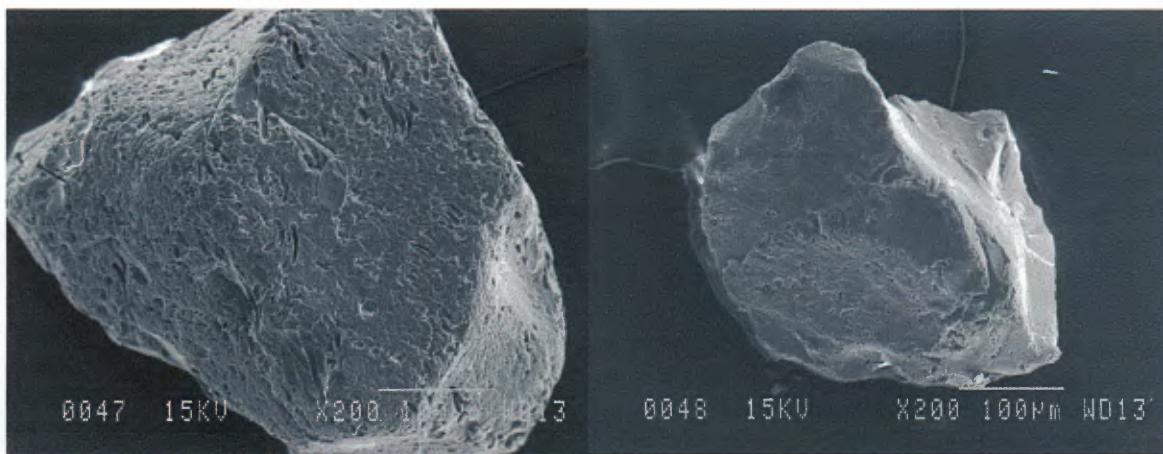

Figure 17: SEI-SEM electronic images of the olivine grains. Notice the small round chromite inclusion in the olivine of the left picture and the typical etched textures left by serpentine alteration.

## INTERPRETATION<sup>2</sup>

Indicator minerals are sufficiently abundant in Premier property to spur interest, although not sufficiently abundant to make a dependable interpretation. Chemical signatures of the indicator minerals show similarities with both the Portage-Renard panache to the north, as well as with Beaver Lake kimberlite to the east. Shall be considered that indicators minerals from Portage panache shows a chemistry suggestive of very good diamond potential of the source kimberlites, as witnessed by the Renard intrusions. Inversely, the Beaver Lake intrusion is practically barren of diamond, as forecast by its mineral chemistry.

No KIM high count samples were found yet on Premier. The KIM distribution do not seems to be random, and part of the minerals seems to be structured as a dispersion train. Furthermore, KIM are dominantly located in the upper third of the property, being scattered occurrences in the south.

Dubious indicator minerals were indicated on the KIM distribution maps. These include minerals which composition is not exclusive to kimberlitic occurrences and are common within regional crystalline environment, such as

<sup>2</sup> The interpretation of results is made according to author's best knowledge and remains intrinsically not thoroughly dependable. It shall not be considered by readers as certainties and the author do not take any liability concerning their use by the client or someone else.

**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

ferrochromite, olivine, G5 and G7 garnets. Also were added minerals which do not have a chemical signature typical of kimberlitic origin, but still have surface textures or other physical features which may suggest they resided in a kimberlitic magma. These are corroded or shiny ilmenites and vivid green diopsides.

***Follow-up on sample 4130006***

Sample 4130006 is of concern, since it contains an high chromium lherzolitic pyrope. It has been described as an ablation till in hummocks moraine. Fluted moraines or drumlins are present about a kilometer to the south, while an esker is present about a kilometer to the north. Nothing indicates that original and follow-up samples might have been taken from different material, nor that any outwash material being present in the area. This pyrope shall be considered as background signal and likely far traveled. Abundant pyropes of this kind were located in Melkior's property, about 20 kilometer up-ice of the present occurrence. No further work is recommended upon target 4130006.

***Follow-up on sample 4130008***

Sample 4130008, which contain an isolated picroilmenite, is of dubious origin, either sandy outwash material or coarse and well washed ablation till. Aerial photograph suggest hummock moraines, while a short esker terminate less than 1 kilometer up-ice. Follow-up samples were taken from this esker and hummock moraine, which did not returned any indicator minerals. No further work is recommended upon target 4130008.

***Follow-up on sample 4130021***

Sample 4130021, which yield a picroilmenite, is reported as a sandy-gravelly ablation till, with a topography typical of hummock moraine. Numerous linear features, induced by basement structures, are discernable, suggesting a thin till covers. Numerous ilmenites were suspected to be kimberlitic in one of the follow-up sample, based upon their shininess. They all failed to be magnesium bearing and thus no kimberlitic indicator mineral were found in follow-up samples. No further work is recommended on target 4130021.

**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

***Follow-up on sample 4130026***

A picroilmenite has been recovered from sample 4130026. This sample has been described as an outwash or esker material, coarse and gravelly. According to aerial photograph, sample was taken at the edge of a fluvial terrace associated with Eastmain River. Follow-up samples, taken up-ice, were ablation till from hummock moraines, and might not represent same material as initial samples. Exception is sample 4130087, southmost of the fence, where a picroilmenite and a Cr-diopsid were found. It shall be noticed that overburden in this area is complex, with local outcrops on hilltop, and ablation till merging with outwash material. A large sampling gap is present to the north, which justify some in-fill sampling. A nice round lake, 200-300 meters across, is present 1.5 kilometer up-ice.

***Follow-up on sample 4130029***

Sample 4130029 returned 3 potentially kimberlitic garnet, of which was the high-chromium harzburgitic pyrope plus a Cr-poor lherzolitic pyrope. Adjacent was sample 4130036 which yielded another lherzolitic pyrope. Sample 4130029 is a sandy ablation till, taken from an area of washed hummock moraines (**figure 16**). These results prompted a dense follow-up sampling, built as three up-ice fences for a total of 23 samples, plus 16 samples for target 4130036. The last fence is located along the northern property limit. A total of 11 indicator minerals were found in these, scattered with a maximum of two indicators in a single sample. No clean dispersion train can be outlined. The terrain where follow-up samples were taken is covered by hummock moraines, with increasingly smooth texture northward. A large outwash plain is suspected about 5 kilometers to the north. A few of the samples were clay rich and interpreted a basement till. The actual distribution pattern suggest samples are from the tail of a dispersion train, the source of which might be located north of the property limits. To proceed with further sampling of the area will necessitate an effort to dig through the ablation till and potential outwash material, which would be a costly effort. An airborne survey would to pinpoint target will be more recommended.

***Follow-up on sample 4130035***

Sample 4130035 yielded a picroilmenite. The sample is from ablation till, from an area of corrugated or transverse moraine. Two follow-up samples carried single indicator, both from ablation till. In such rugose area, it should not be

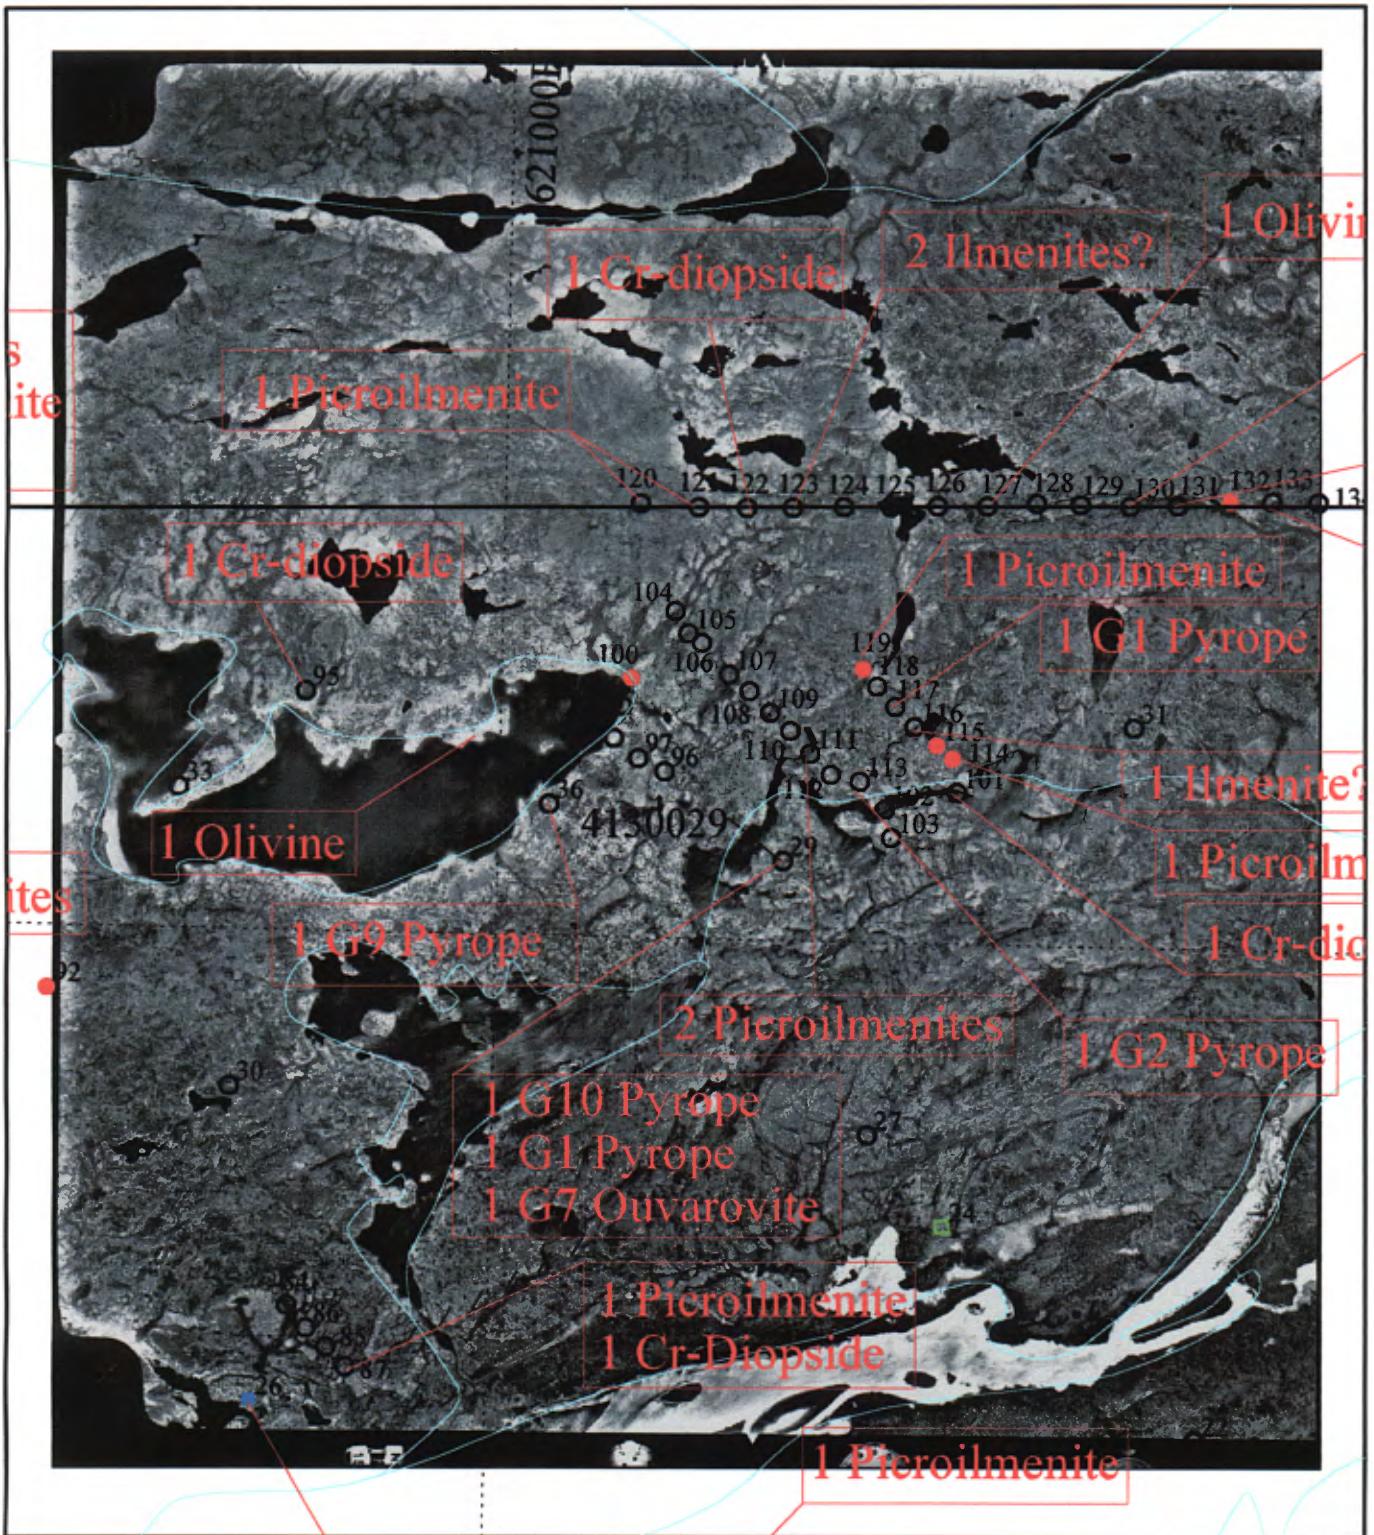

Figure16: Target 4130029 follow up results

## **TILL SAMPLING FOLLOW-UP PREMIER PROPERTY**

expect dispersion train will be uniform and regular. It can not, with actually available data, decipher whether these kimberlitic minerals belong to a distal signature of a trend or if they are background values. Supplementary sampling is needed.

### ***Follow-up on sample 4130036***

A lherzolitic pyrope was located in sample 4130036, which spurred a dense follow-up sampling. No information is available on the nature of the sample. It is from an area covered by smooth hummock moraine, likely fusion till affected by superficial meltwater washing. Two fences of follow-up samples were taken, which failed to reproduce the anomaly. Scattered count were found in samples from a fence at the limit of the property, which is located in heavily washed material.

### ***Follow-up on sample 4130037***

A Cr-diopside has been located in sample 4130037, which is from a coarse ablation till in an area covered by hummock moraines, possibly controlled by relict corrugated moraines. An esker run 200 meters to the north. Numerous large erratic boulder are present on top of the till, suggesting that surface has been washed by subglacial rivers associated with the esker. A fence of four samples has been taken as follow-up, all of them within the ablation till. One of them, located directly up-ice from target, carried a single picroilmenite. These two samples might be distal expression of a narrow dispersion train, and may justify some further work. But it can not be excluded that these two grains are from background signal. No till sample are presently located up-ice for a few kilometer.

### ***2003 Regional samples***

A few of the regional samples collected in 2003 carried isolated indicator minerals, such as 4130094, 4130095, 4130135, and 4130140. Since they are located close to property limits, no follow-up is recommended. Sample 41300093 shall be considered one of these, since from the 4 potential indicator reported, only one has an non dubious origin.

**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

***Geochemistry of mud***

Mud recovered off the Wilfley table has been submitted for a 33 elements analysis. Results are presented on **figure 17** along with basement geology. The element package includes chromium and nickel to detect ultramafic signature along with strontium, barium and lanthanum to detect alkaline signature. Manganese is added, being an indicator for metal scavenging through chelation. Only a few samples show chemical activity in spite of lack of chelation, such as 4130075. Chemical activity associated with chelation is noted in sample 4130032, 4130035, 4130086, 4130089 and 4130135. No chemical anomaly is noticed within the 4130029 follow-up sampling.

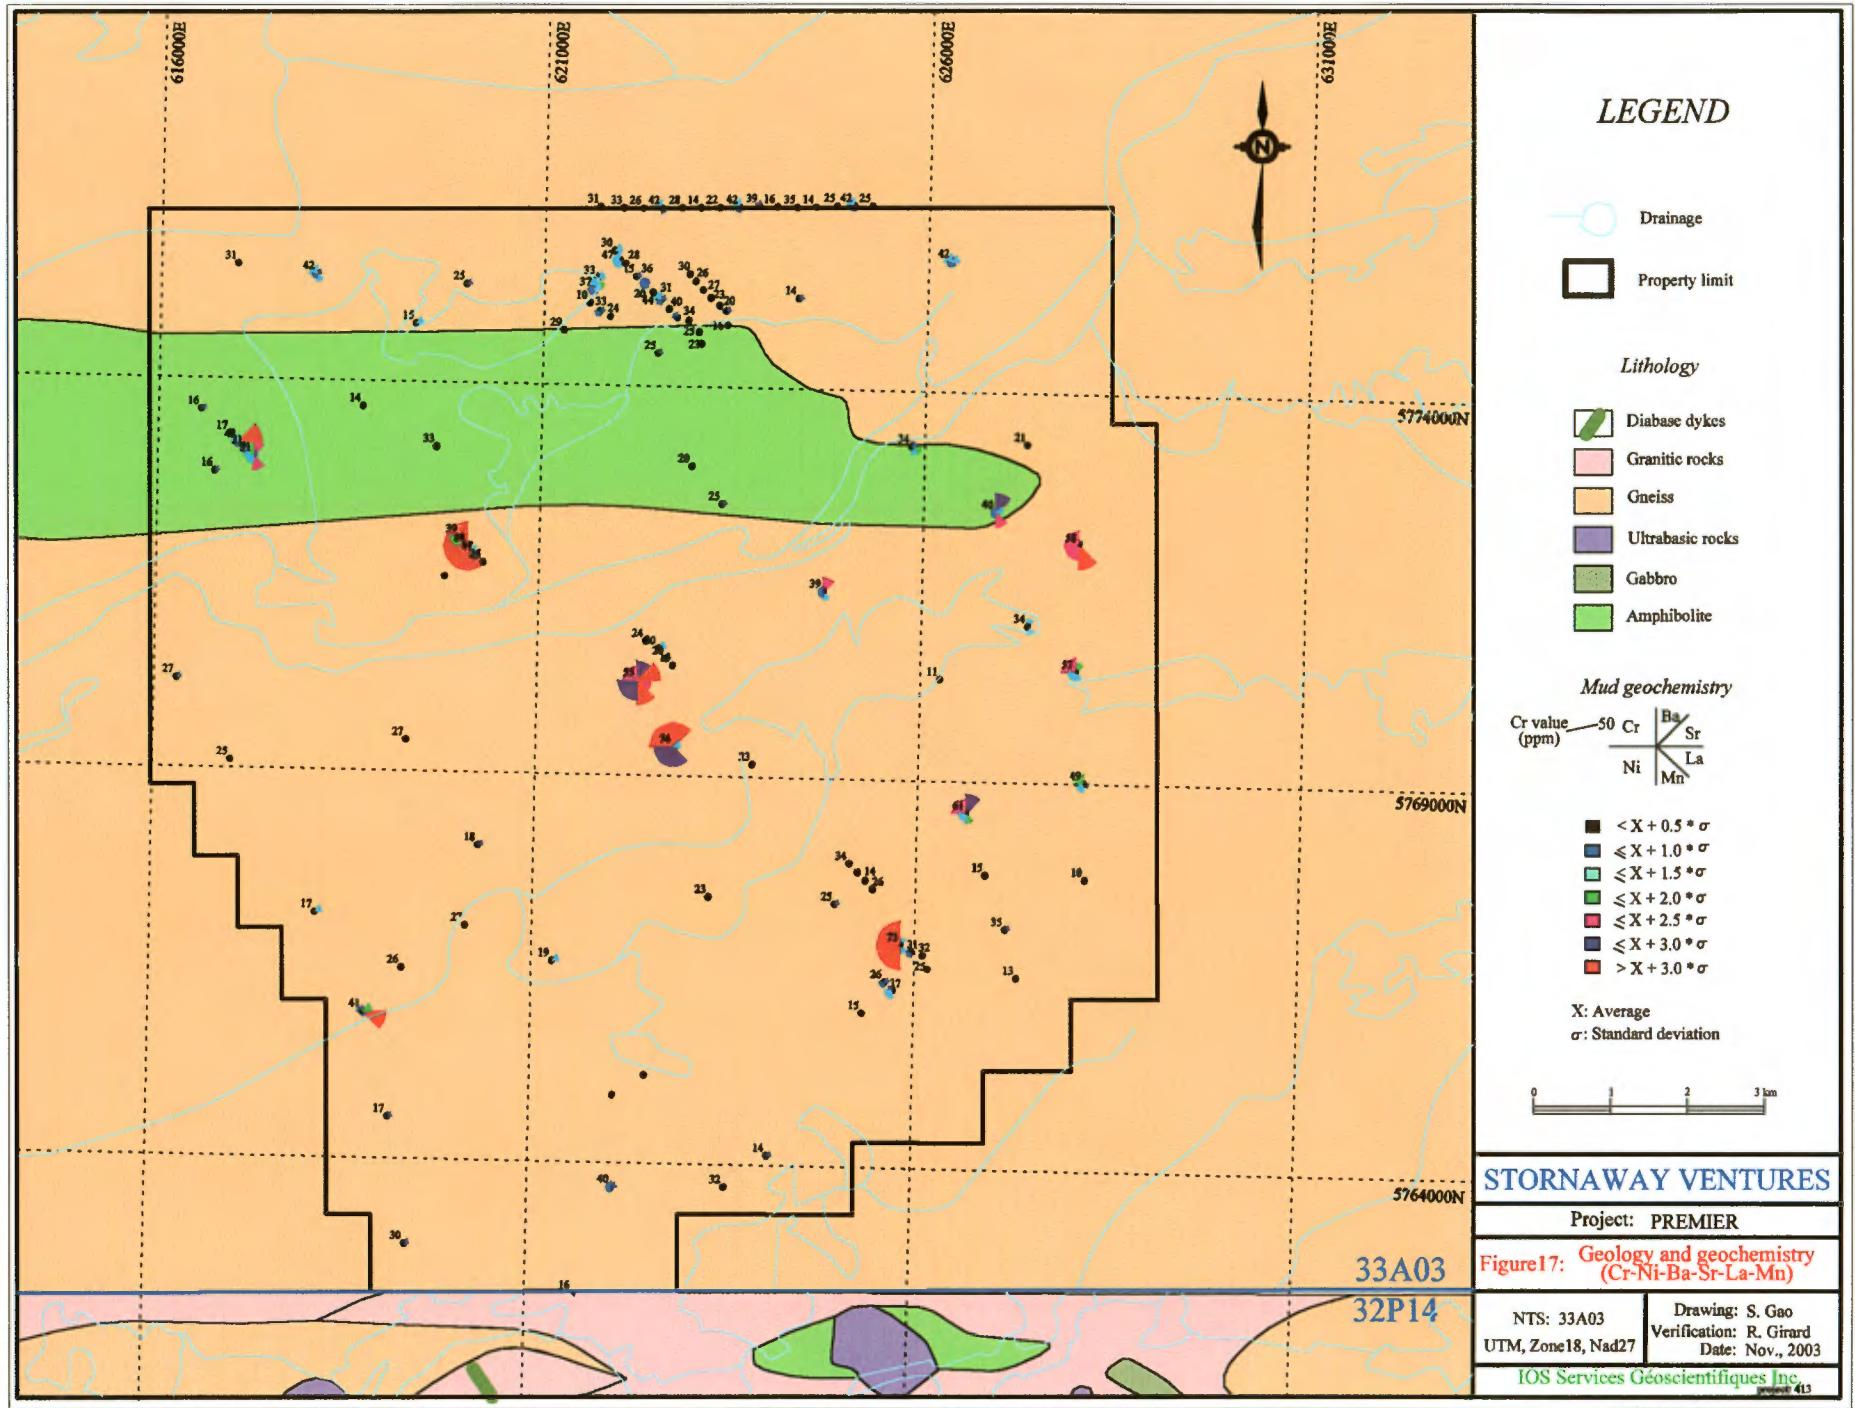

***Base metal anomalies***

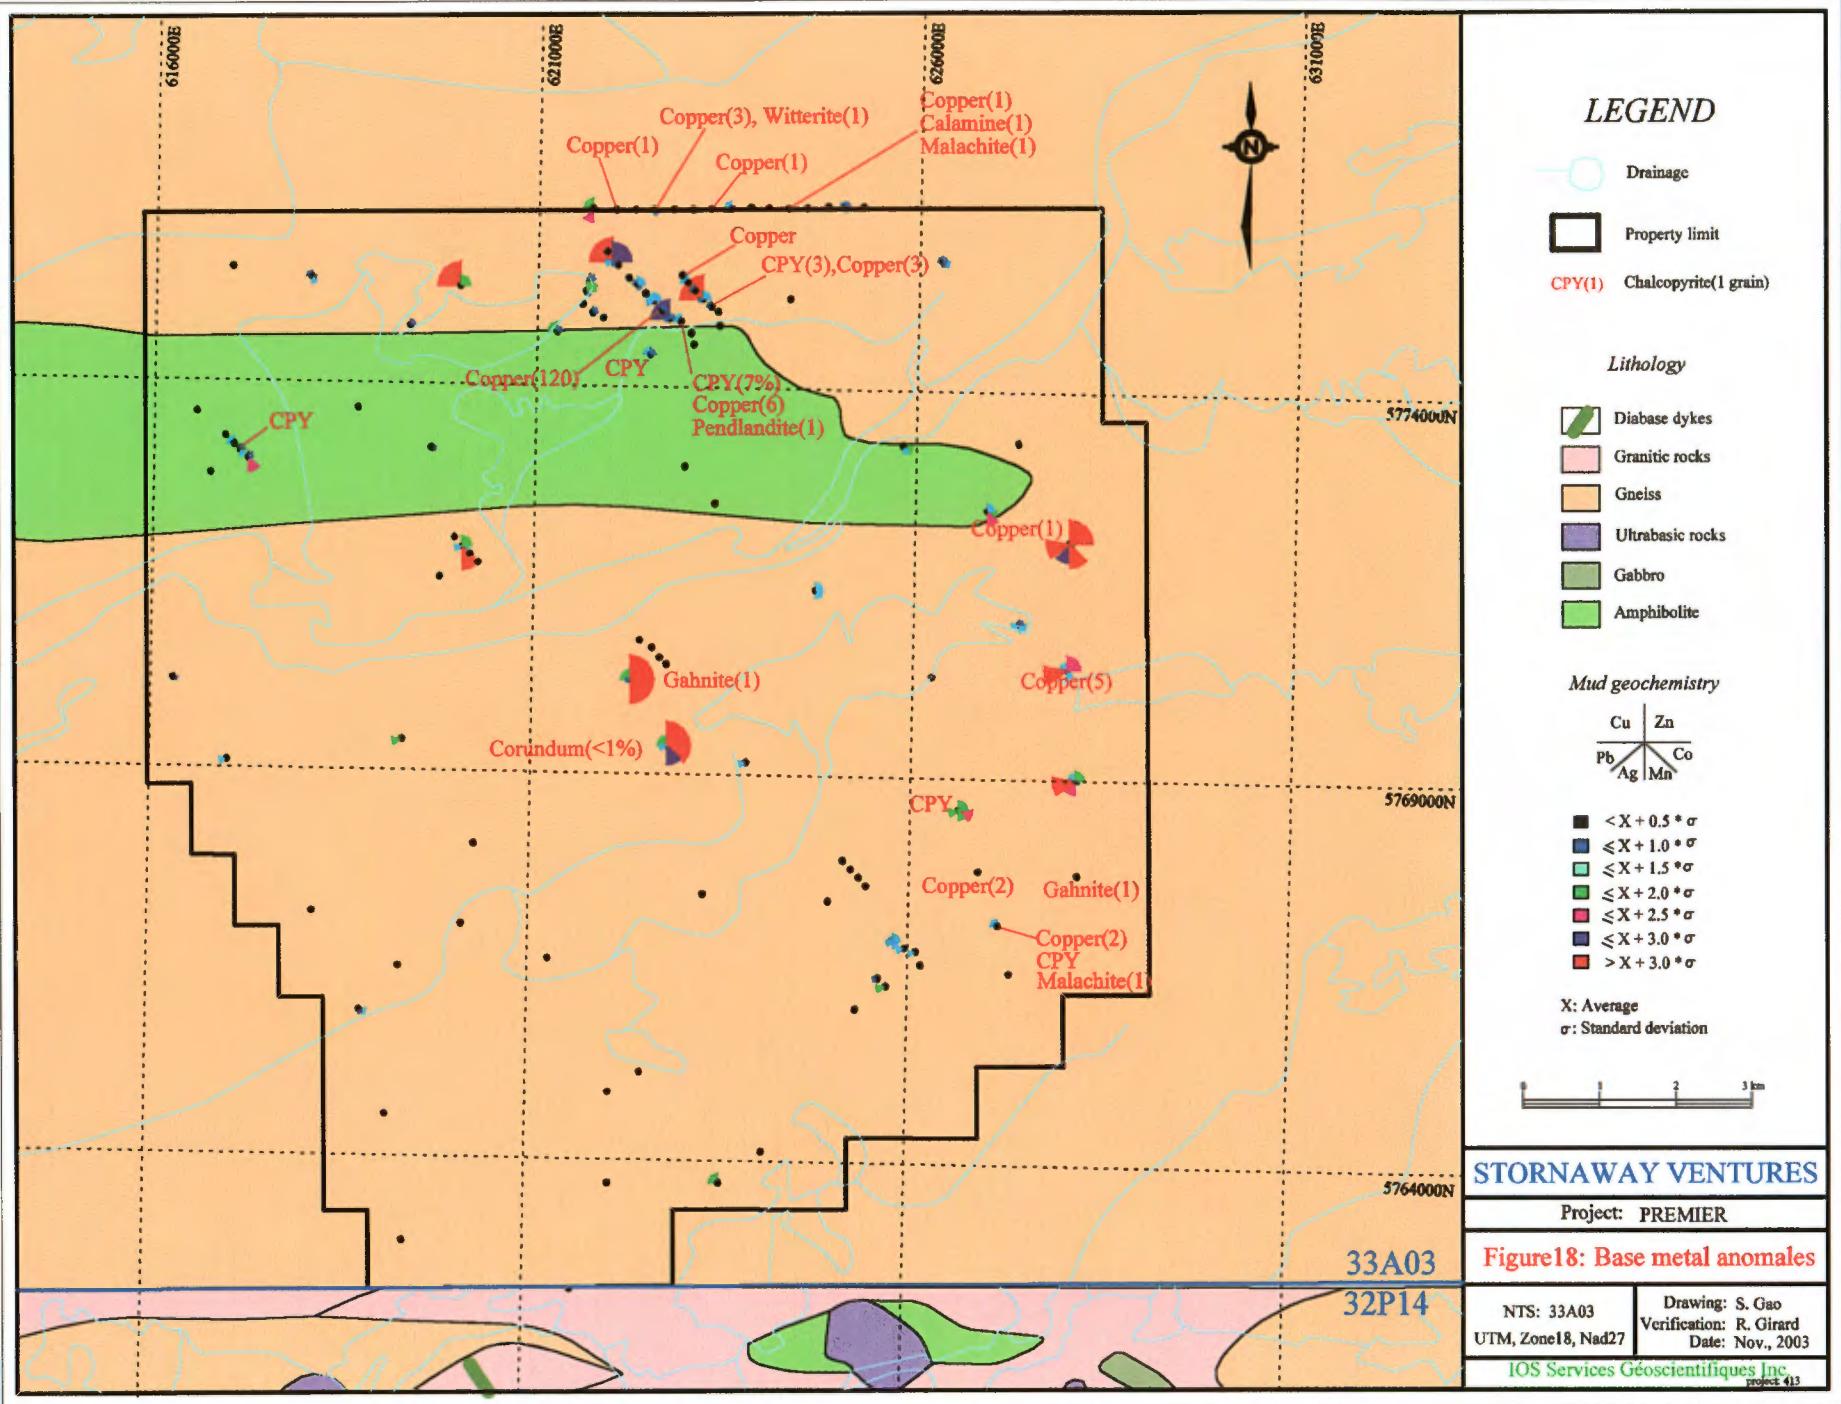

Base metal occurrences are indicated either by sulfides in the heavy mineral concentrate, or by geochemical anomalies in the mud (**figure 18**). A significantly anomalous sample is 4130113, in which 126 grains of chalcopyrite were present. No iron sulfides nor other base metal indicator were associated. No meaningful geochemical anomaly is detected in this sample. However, in the neighboring sample and the up-ice fence, a few grains of chalcopyrite plus some chemical Cu anomalies are detected. The anomaly totally disappear in the fence along the property limit. The origin of this anomaly is likely associated with the metavolcanic belt, which ended roughly below the sample. Two other significant anomalies are detected in samples 4130094 and 4130105. Other anomalous sites are associated with manganese and suspected as metal scavenging due to ferrochelation.

A few grains of gahnite are the only zinc mineral found. A single grain of pentlandite is present in sample 4130113. Corundum is abundant in sample 4130032, which is a mineral indicative of alkali lixiviation associated with alteration zone.

Some copper dendrites and flakes were found in random samples. These are suspected as contamination from the heavy liquid stabilizer. A few flakes of calamine, witherite and malachite were also detected with the SEM-EDS, suspected as reaction product between brass or tin (both contamination from sieves) and oxalic acid.

An exploration program can be justified upon anomaly 4130113, starting with an EM airborne survey carried along the aeromagnetic survey recommended for diamond exploration.

## TILL SAMPLING FOLLOW-UP PREMIER PROPERTY

### Precious metal anomalies

No gold grains were found, nor very limited number of arsenopyrite or lollingite grains. A single sample shall be considered anomalous, 4130121, with arsenopyrite making about 1% of the diamagnetic fraction. No geochemical anomaly of arsenic, bismuth, antimony or other pathfinder elements is detected (**figure 19**).

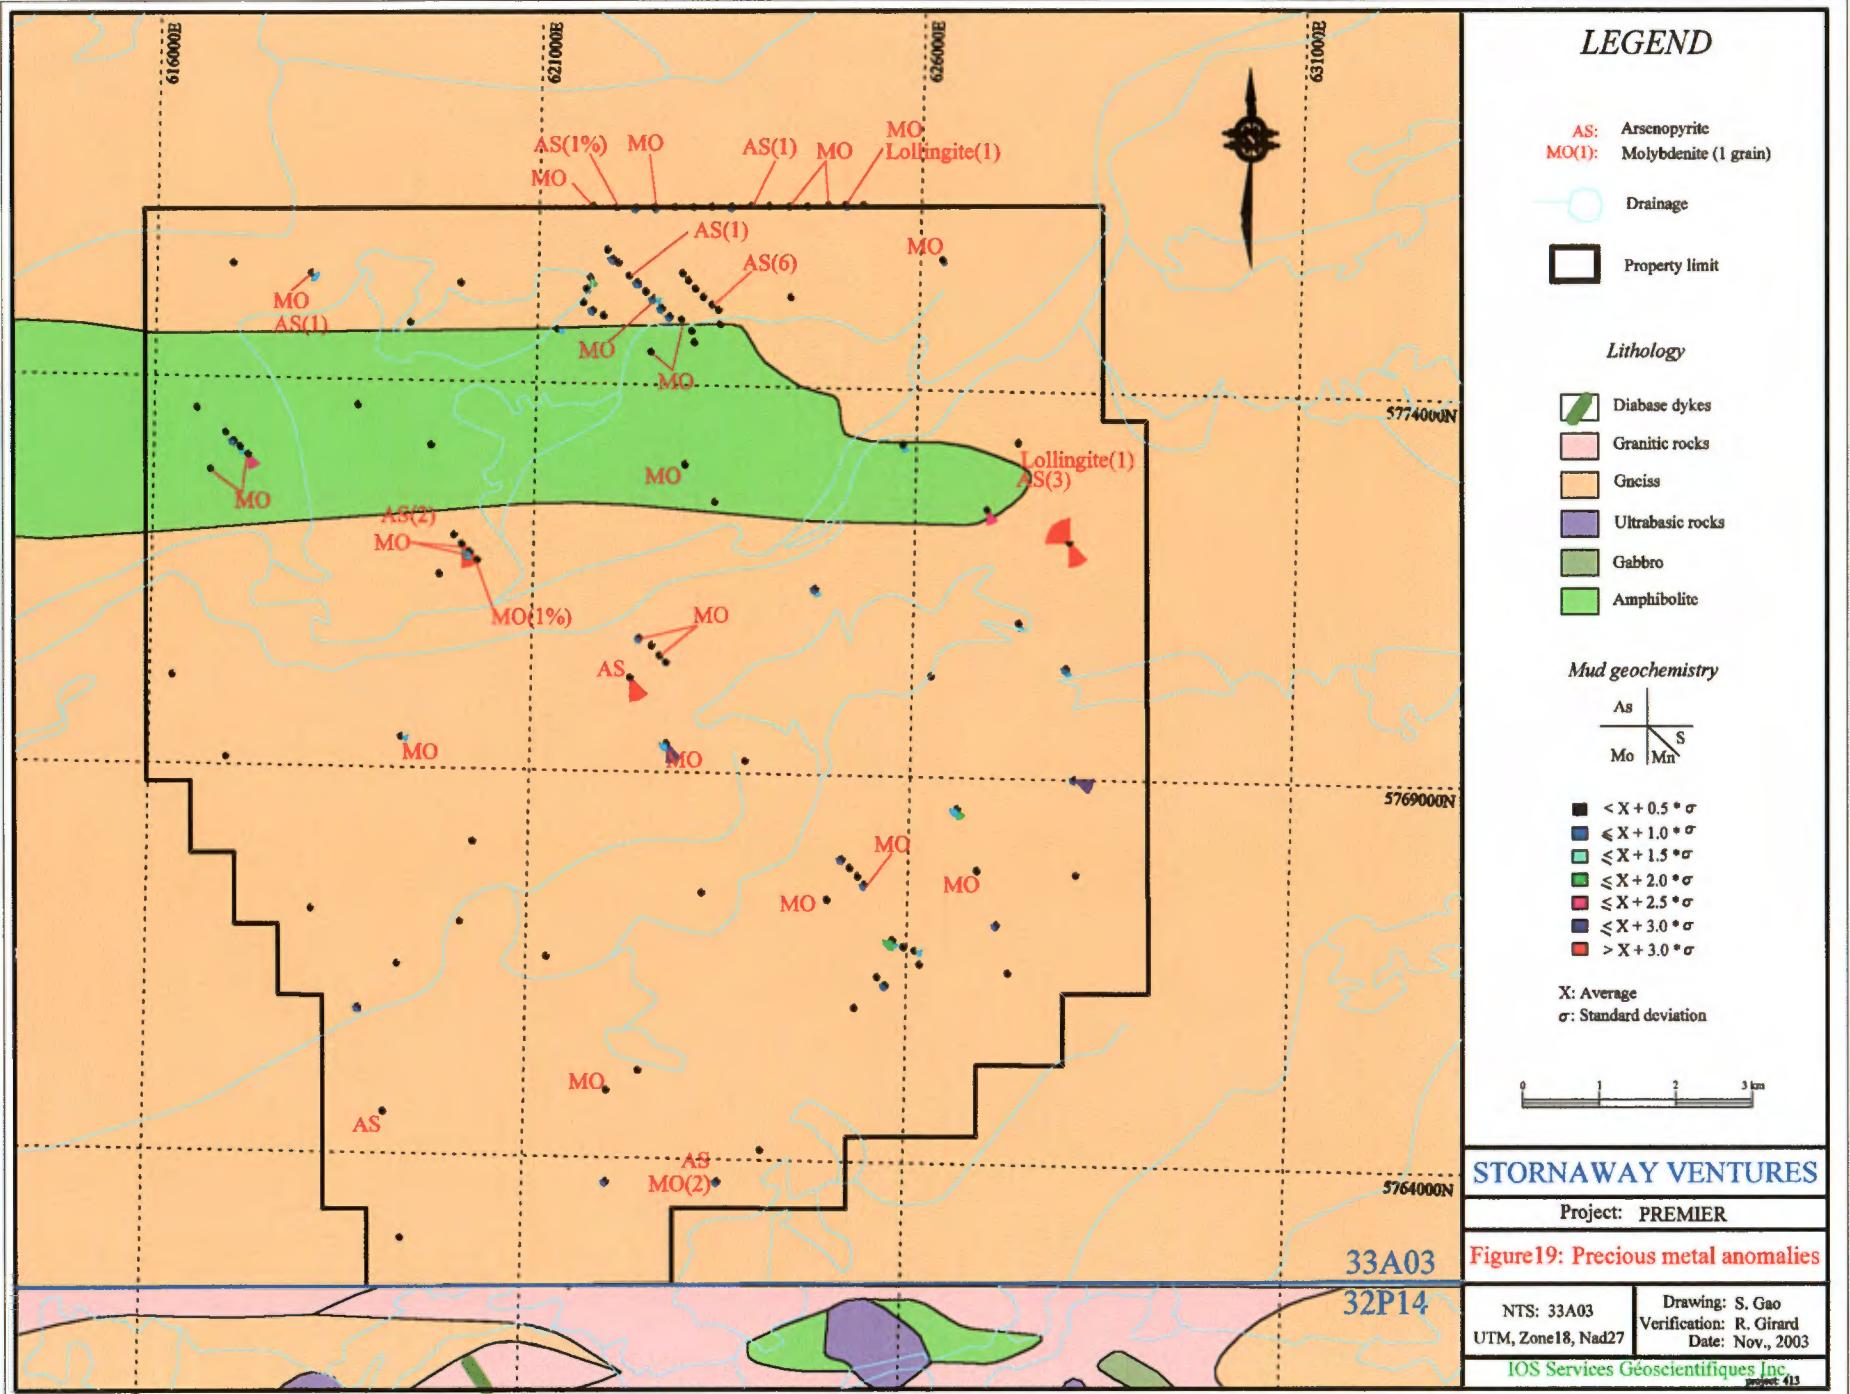

### RECOMMENDATION

It is recommended that the northern portion of the property being renewed and that further exploration work being carried. Since this area is covered with a blanket of ablation till, pin-pointing a kimberlite with the use of surface till sampling might be a difficult task. A dense low-altitude helicopter-borne magnetometric and electromagnetic survey is recommended, for 250 kilometer of flight along 100 meter spaced lines. Hand shoveled or mechanized auger sampling of lodgment till will be required next.

It is also recommended that a few samples being taken up-ice of targets 4130026, 4130035 and 4130037.

**FIELD LOG**

**TILL SAMPLING FOLLOW-UP  
PREMIER PROPERTY**

**RAPPORTS JOURNALIERS PROJET 03-413**

**Samedi, 9 août 2003**

Départ de Chicoutimi à 8 h am de Patrice, Alexandre, Steeve, Jean-Michel et Jonathan direction Rivière Témiscamie. Arrivée à destination à 3 h pm. L'avion a pu nous emmener au camp du Lac Hippocampe en 2 voyages car il y avait de l'épicerie à apporter avec nous.

**Dimanche, 10 août 2003**

Arrivée de l'hélicoptère vers 11h45 am, au moment où la brume matinale épaisse se soit dissipée. Départ sur le terrain vers 13 h direction du suivi au nord de la propriété. 20 échantillons ont été récoltés aujourd'hui en quelques heures de travail: 10 sur la ligne bordant complètement le nord et 10 sur la grille des échantillons 4130029 et 4130036. L'échantillonnage s'est bien passé et les échantillons sont restés sur le terrain. 1.3 heures de vol utilisées et 1 baril provenant d'Hippocampe.

**Lundi, 11 août 2003**

31échantillons ont été ramassés aujourd'hui sur la propriété, majoritairement dans la partie nord. Nous avons terminé la cible principale, fait quelques échantillons de régional et deux autres cibles. Un voyage d'une vingtaine d'échantillons ont été apportés à Témiscamie en hélicoptère. Temps de vol = 4.7 h et 4 barils utilisés ; 2 de Témiscamie et 2 Hippo.

**Mardi, 12 août 2003**

Nous avons récolté les derniers 23 échantillons restants sur le propriété Premier pour un total de 74 échantillons. De ce nombre, 69 sont déjà rendus à Témiscamie et 5 sont toujours au camp Hippocampe. Temps de vol utilisé 6 = et 3 barils à Témiscamie.

Sample number	Glacial material type	Surface boulder type	Outcrop	Glacial form	Landform, drainage, surrounding
4130068	Glaci-fluvi, esker	Granite.			Pris dans flanc d'un esker (flanc sud), couleur beige, subarrondi, B <sub>2</sub> très riche en sable, C plus riche en gravier.
4130069	Fusion till	Granite, granodiorite, tonalite			Echantillon récolté à 75m au nord d'un lac, sur la pente sud d'un button de till, sec drainage excellent, beaucoup d'arbres (brûlé) till sablo-sileux, peut ressembler à un fluvi mais l'angulette des blocs laisse croire le contraire. Beaucoup de blocs anciens en surface.
4130070	Fusion till	Pink granite, gneiss, granitoïde			Till de fusion sableux pris au sommet d'une colline de till avec beaucoup de blocs en surface. Endroit plat, sec, faible végétation, lac à 100m au nord.
4130071	Fusion till	Granitoïde, gneiss			Till de fusion sablo-sileux pris sur le dessus plat et sec d'une butte de till nord-sud, beaucoup de blocs en surface, ancien brûlé, présence de ferricroûte mince, plus épaisse au bas de la butte près d'un lac, petite l'm au nord, petite mouvance vers le lac.
4130072	Fusion till	Granitoïde			Till de fusion sablo-sileux échantillonné dans une forêt peu dense, endroit sec, quelques blocs en surface, légèrement en pente vers le sud, échantillonné sur une butte de till.
4130073	Fusion till	Gneiss, granitoïde			Till de fusion sableux avec beaucoup de gravier détruit de toutes ses fines, pris sur le flanc sud d'une colline nord-est-sud-ouest à 3m d'un lac. Endroit penté faiblement, sec, peu boisé, pris dans un champ de buttes décalées à matériel bizarre, ressemble à un esker mais plus sous-sol.
4130074	Fusion till	Pink granite, gneiss, paragneiss to biotite garnet			Till de fusion sableux avec beaucoup de gravier, ressemble à un fluvi mais plus anguleux, pris sur une colline de matériel glaciaire, flanc sud, pente douce, endroit sec, peu boisé, près d'un lac (30m)
4130075	Fusion till	Gneiss, granitoïde, paragneiss to biotite garnet			Till de fusion sableux, beaucoup de gravier (cailloux et gravier). Till détruit des fines, ressemble à matériel d'esker mais anguleux, pris sur le sommet plat et sec d'une colline de dépôts glaciaires avec beaucoup de blocs en surface, fragments décomposés de matières dans échantillon horizon B. Achantilloné iron block et pyrite.
4130076	Fusion till	Bdg, à lot, granite			Till sableux et compact, à flanc nord d'une chaîne de collines abrupte échantillon pris entre deux plis, bon drainage, colline entourée de swamp, couleur beige-gris, blocs - boulder de l'horizon B <sub>1</sub> .
4130077	Fusion till	Granite			Beaucoup de blocs (granite) en B <sub>1</sub> et B <sub>2</sub> , entouré de gros bouliers, drainage moyen (un peu humide) bordure de swamp (200), till sableux, couleur beige orangé, dans le bas d'une petite colline.
4130078	Fusion till	Frequently, different size granite			Till sableux, fond plat entre deux collines (petites), bon drainage, bloc de granite B <sub>2</sub> , couleur beige-orange pâle.
4130079	Fusion till	Granite, gneiss			Dans le bas du flanc sud (340) d'une colline, plusieurs gros bouliers, plusieurs collines ailleurs, plusieurs blocs dans B <sub>2</sub> et B <sub>1</sub> , till sableux riche en cailloux, couleur beige orangé.
4130080	Fusion till	Low quantity of granite			Till sableux, environnement collineux, conclusion : 1 à l'est, 1 au nord, 1 au sud-ouest, l'autre trou se situe au centre, endroit bien drainé, bloc se trouvant dans le B <sub>1</sub> - B <sub>2</sub> .
4130081	Fusion till	Granite			Till sableux, facilement échantillonnable, couleur gris beige, forêt brûlée, en bordure d'une swamp (ouest), peu de blocs en surface, plusieurs petites collines, très bon drainage.
4130082	Fusion till	White and pink granite, medium quantity			Till sableux, sur sommet d'un button, drainage excellent, facilement échantillonnable, blocs en faible quantité, un beau gris beige.
4130083	Fusion till	Granitoïde and gneiss			Till sableux, croûte 5 à 10cm, au sommet d'une colline (à l'ombre d'un arbre), environnement = alternance de swamp et de collines, très bon drainage, couleur gris beige.
4130084	Fusion till	Some block in surface			Till sableux, dans le début d'une petite pente, bon drainage, végétation moyenne.
4130085	Fusion till	A few block of granite, little			Till sableux situé sur un affleurement, bon drainage, bonne oxydation (ferricroûte), végétation moyenne.
4130086	Fusion till	Granite			Beau till sableux, bon drainage, gros blocs autour, plusieurs blocs dans B <sub>2</sub> et C, environnement = forêt peu dense.
4130087	Fusion till				Beau till sable et silt, facile à échantillonner, pas de cailloux dans B <sub>2</sub> , plusieurs cailloux dans C, au pied d'un button, bordure d'une swamp, bon drainage.
4130088	Fusion till	Granite and gneiss			Till de fusion sablo-sileux pris sur le flanc nord d'une montagne de granite, endroit en pente faible vers le nord, boisé faiblement et sec, peu de blocs en surface, quelques uns dans le till.
4130089	Fusion till	N/D			Till de fusion sablo-sileux avec beaucoup de cailloux, pris flanc sud d'une montagne recouverte de till, endroit en pente forte vers le sud, sec, boisé de bouleaux, pas de blocs en surface.
4130090	Basal till	Granitoïde, gneiss	Granitoïde		Till de fond pris au dessus d'un affleurement, peu de cailloux, très silieux, mélange avec B <sub>2</sub> parce que couche trop mince pour remplir le sac, endroit plat, sec, légère pente vers le nord-est, blocs mététriques en surface.
4130091	Fusion till	N/D			Till de fusion sableux pris sur le dessus de la montagne, endroit sec, boisé, pente vers le nord faible, pas de blocs en surface, peu dans le till, sable assez fin dans le till.
4130092	Basal till				Échantillon récolté sur une pente dans une petite vallée entre 2 montagnes, pente vers l'ouest, mauvais drainage, humide, ruisseau, roc peu profond, difficile de trouver du till. Impossible de voir l'affleurement (humide), peu d'arbres.
4130093	Fusion till				Échantillon récolté sur un button de till, pertout autour le sol est composé de fluviatile et c'est plat, sec, drainage excellent, beaucoup d'arbres, till sableux.
4130094	Fusion till	Granite	Granite		Échantillon récolté sur un petit button de till & proche d'un affleurement de granite (5m environ). Quelques blocs de granite en surface, sec, peu d'arbres, bon drainage, till sileux, semble recouvrir un fluvi glaciaire circulaire.
4130095	Fusion till				Échantillon récolté à 75m au nord-est d'un lac, pente vers le sud-ouest, drainage moyen, peu d'arbres, blocs, till sableux.
4130096	Fusion till	Granitoïde, gneiss			Till fusion sablo-sileux pris en bordure d'une swamp (10m) au bas d'une colline de till est-ouest, endroit plat, sec, boisé, légère pente vers le sud (swamp)
4130097	Fusion till	Granitoïde			Till de fusion sableux pris sur le till est-ouest, situé près d'une swamp (50m), endroit boisé faiblement.
4130098	Fusion till	N/D			Till de fusion sablo-sileux pris sur le flanc nord d'une butte de till, endroit en pente douce vers le nord, sec, boisé, pas de blocs en surface.
4130099	Fusion till	N/D			Till de fusion sableux avec silt pris sur le sommet d'une butte de till est-ouest, endroit plat et sec, boisé, pas de blocs en surface, beaucoup dans le till.
4130100	Basal till	Gneiss, gabbro, granitoïde			Till de fond pris sur une plaine (champ de blocs) en bordure d'un lac, endroit plat, sec, boisé, blocs décimétriques en surface. Pas de blocs dans le till, quelques cailloux et un peu de gravier, beau till de fond silieux.
4130101	Fusion till	Low quantity of granite, little			Till sableux situé à 120m de la cible qui se trouvait dans le centre d'un lac (très minuscule), sur un button peu boisé, endroit bien drainé, sans difficulté.
4130102	Fusion till	no			Beau till sableux sur colline en bordure d'un lac, peu de cailloux en B <sub>1</sub> , un peu de croûte (10 à 15cm), peu d'arbres, bon drainage.
4130103	Fusion till	Few of granite and granodiorite			Till sableux sur bas d'un button, 1er essai => argile unique, 2e essai => 10m de la cible, bon drainage, forêt peu dense.
4130104	Fusion till	A lot of granite, big			Till très sableux, beaucoup de blocs autour, en pente, trouvé beaucoup de fluvi alentour (3 essais), mauvais drainage
4130105	Fusion till	Beautiful granitoïde and granodiorite			Till sableux situé au bas d'une pente douce, bien drainée, très compacté, légère oxydation, blocs en grande quantité, forêt légère.
4130106	Fusion till	Granitoïde			Bordure d'une swamp (150°), point impossible à recréer en plein milieu d'une swamp, beau till sableux facilement échantillonnable, très mauvais drainage, plusieurs blocs granite en B <sub>1</sub> , dans le bas d'une pente.
4130107	Fusion till	A few granitoïde, big			Till sableux humide sur fond plat mal drainé. Environnement composé d'arbres, beaucoup de gros blocs d'horizon B <sub>2</sub> .
4130108	Fusion till	Granite, paragneiss			Till sableux (till de fusion) bon drainage, un peu de croûte environ 5cm, beaucoup de blocs en B <sub>1</sub> , => granite, paragneiss, pente douce, environnement => forêt.
4130109	Fusion till	Granitoïde			Pris dans une légère pente 70m nord-est d'un champ de boulder, bon drainage, till sableux sec. Quelques gros blocs de granite, horizon B <sub>1</sub> , environnement composé de forêt moyennement dense.
4130110	Fusion till				Échantillon récolté sur un button (très sableux dans les flancs), très sableux, bon drainage, beaucoup de cailloux.
4130111	Fusion till				Échantillon récolté sur une pente légère vers le nord, lac à 75m au nord, till sableux bon drainage, très blocs, quantité d'arbres moyennes.
4130112	Fusion till	Granitoïde			Échantillon récolté entre des buttons de till, endroit très valonné, quelques blocs en surface, difficilement creusables (compact et blocs) beaucoup de blocs, sec et bon drainage, quantité moyenne d'arbres, till de fusion sableux (très peu de pente vers le sud).
4130113	Fusion till	Granitoïde			Échantillon récolté sur un button de till, lac à 25m au sud-ouest, quelques blocs en surface, sec et bien drainé, peu d'arbres, till de fusion sableux.

Sample number	Glacial material type	Surface boulder type	Outcrop	Glacial forms	Landform, drainage, surrounding
4130114	Basal till				Échantillon récolté en bas d'une légère pente vers l'est, lac à 75m vers le sud-est, plat et mauvais drainage, quantité d'arbres moyenne, till silto-sableux.
4130115	Basal till				Échantillon récolté entre des buttes de till, terrain valonneux, sec et peu d'arbres mais très compact et peu de cailloux, till de fond.
4130116	Fusion till				Bordure d'un lac, blocs anguleux, plusieurs gros boulders, till silteux, bon drainage
4130117	Fusion till	Granitoïde			Échantillon récolté sur le flanc sud-ouest d'une montagne, quelques blocs de granite en surface, till silteux, pente forte, beaucoup d'arbres, bon drainage.
4130118	Fusion till				Échantillon récolté au sommet d'un button plat au sommet, till sableux, sec, beaucoup d'arbres, excellent drainage
4130119	Basal till	Granite			Plat et sec, bon drainage, peu de blocs, till silto-silteux, beaucoup d'arbres
4130120	Fusion till	N/D		Gneiss	Till de fusion sableux avec peu de cailloux et till, endroit en pente faible, flanc sud d'une butte de till, endroit sec et boisé. On a ramassé horizon B <sub>2</sub> parce qu'on est arrivé sur un affleurement à 70cm, nappe phréatique à 70cm.
4130121	Fusion till	Gneiss, granitoïde			Till de fusion sableux avec bonne proportion de sable fin (silt), endroit en pente moyenne vers le sud, sec, boisé, peu de blocs en surface et dans le till, beaucoup de boulettes silteuses ± oxydées
4130122	Fusion till	Granitoïde			Till de fusion sableux avec des passes sablieuses et silteuses, endroit plat et sec, boisé, affleurement cailloux et blocs en surface, flanc sud de montagne.
4130123	Fusion till	Gneiss, granitoïde			Till de fusion sable-graveleur, un peu de fines, endroit plat et humide, sommet butte effleurement, endroit boisé, effleurement à 0.5m, till au-dessus avec poches de sable et silt.
4130124	Fusion till	Gneiss, granitoïde		Gneiss	Till de fusion, flanc nord d'une colline légèrement en pente (vers le nord), endroit peu boisé, assez sec, fin du trou sur affleurement à 1m, humide, quelques blocs en surface, déclimatique à métrique.
4130125	Fusion till	N/D			Till de fusion silto-silteux pris en bordure d'un lac (5m), endroit plat sec et boisé, au pied de montagne, beau till gris, pas de blocs en surface, peu dans le till.
4130126	Fusion till	Gneiss			Till de fusion, bas d'une butte de till côté ouest, endroit sec, légère pente, à proximité d'une swamp environ 15m
4130127	Fusion till	Gneiss, granitoïde			Till de fusion sableux avec bonne proportion de silt, endroit plat et sec, boisé au sommet d'une colline de till, peu de blocs en surface, un peu dans le till, beau matériel gris calcaire, légère pente vers l'est.
4130128	Fusion till	Gneiss, granitoïde			Till de fusion sableux pris au pied d'une colline de till, près d'un ruisseau (5m), endroit plat, sec peu boisé, peu de blocs en surface, un peu dans le till, couche de fluviatile sous le till.
4130129	Fusion till	N/D		Pink granite	Till de fusion sableux avec un peu de silt et cailloux, pris sur le dessus d'un affleurement, endroit plat et sec, boisé, ressemble à un fluviatile cailloux anguleux, peu de blocs en surface et dans le till
4130130	Fusion till	Gneiss			Till de fusion silto-silteux pris sur le flanc nord d'une montagne de gneiss, pente douce vers le nord, endroit plat, sec et boisé, ressemble à till de fond 132-131 mais moins compact et plus cailloux, petite butte de till au pied d'une falaise.
4130131	Basal till	N/D		Gneiss	Till de fond silto-silteux, flanc d'une montagne de gneiss (flanc nord), pente moyenne vers le nord, endroit sec et peu boisé
4130132	Basal till	Gneiss, granitoïde		Gneiss	Till de fond silteux pris sur le dessus d'un affleurement de 40cm de profondeur, endroit plat, sec et boisé, blocs métriques en surface, ruisseau à proximité (5m plus bas), fragments d'amphibolite désagrégés dans la till
4130133	Fusion till	Gneiss, gabbro			Till de fusion sableux pris sur le flanc sud d'une butte de till, endroit sec, boisé, en pente forte vers le sud, cailloux et blocs en surface, champ de blocs métriques au bas de la pente à 10m, au travers champ blocs couche mince de till recouvert du fluviatile
4130134	Fusion till	N/D		Gneiss	Till fusion sableux avec bonne proportion de fines et grossières, endroit plat, sec et boisé, pris sur le sommet d'une butte de till étagée, pas de blocs en surface, pente assez forte vers le sud-ouest à 2m
4130135		Gneiss		Gneiss	Échantillon récolté à 25m à l'ouest d'un lac, plat et sec, drainage mauvais, peu d'arbres, till sableux
4130136	Fusion till	Granite, gneiss			Échantillon récolté entre des buttes de till, terrain valonneux, beaucoup de blocs en surface, pas bon drainage, peu d'arbres, till sableux.
4130137	Fusion till	Tonalité, gneiss, granite			Échantillon récolté à 10m à l'est d'une swamp au sommet d'un petit button de till, beaucoup de gros blocs en surface, sec, bon drainage, peu d'arbres, till sableux, bloueux, difficile à récolter.
4130138	Fusion till	Granite, tonalité			Échantillon récolté à 25m à l'ouest d'un lac, plat et sec, peu d'arbres, beaucoup de gros blocs en surface, till sableux, à l'est d'un button de till
4130139	Fusion till	Quartzite, granite			Terrain valonneux, légère pente vers le nord, beaucoup de blocs à proximité, peu d'arbres, drainage moyen, sec, till silteux
4130140	Fluvi glacial	Granite			Colline au nord (50m), bordure d'un lac au sud (10m) et beaucoup de blocs en surface, ressemble à fluvi glaciaire, très mauvais drainage, beaucoup de blocs dans B <sub>1</sub> et B <sub>2</sub> , pas capable de se rendre à C
4130141	Fusion till	Granite			Échantillon récolté en bordure nord d'une swamp et bordé sud d'un button de till, beaucoup de gros blocs anguleux en surface, plat, peu d'arbres, humide, drainage mauvais, till sableux, trou se rempli d'eau.
