ITEM 3 : SUMMARY

Following the discovery of a Au-bearing boulder (**2.3 g/t Au**) and two new Au showings (**2.2 g/ Au and 4.1 g/t Au**) in the summer of 2004, Virginia Mines Inc. decided to reevaluate them in fall 2005. This small mapping and prospecting campaign intended to verify and confirm the gold potential of the area. These previous works identified a favourable geological environment for Au mineralization defined by a large meta sedimentary package combined with As lake sediments anomalies.

Virginia Mines Inc. consolidated, in fall 2006, its field position by staking a new property covering over 680 km². After this acquisition Virginia undertook an intensive prospecting and mapping program on its Nichicun project, James Bay during the summer of 2007. Exploration work was successful in finding several other mineralized boulders and outcrops. Based on the results of this exploration program, Virginia Mines Inc. acquired new claims covering 70 km² in the northern sector of the Nichicun project.

The main Nichicun block area returned numerous gold anomalies up to **39.2 g/t Au in grab samples**. The previous SE showing was re- sampled and returned **3.7 g/t Au in grab sample**, while a small trenching and channel sampling program was realized on the NW showing and returned **0.6 g/t Au / 3m**. In addition of the prospecting campaign, the geochemical till survey outlined a new gold trend with a unidentified source.

Gold mineralization was found in the new northern Nichicun block area, a favourable bi-modal volcanic context. The contact between the felsic and the mafic volcanic rocks returned values up to **8.5 g/t Au in a grab sample**. The extension of this mineralized context still needs to be investigated.

More mapping and prospecting over both areas is recommended in 2008. Work should be axed on finding the source of the geochemical gold trend, extending the gold bearing bi-modal context and following the mineralization in the SW showing area. A new geochemical survey should be made to improve the definition over the gold trend.

ITEM 4 : INTRODUCTION AND TERMS OF REFERENCE

Since the first work by Virginia in 2004, limited reconnaissance work has been periodically done in the Nichicun area. This persistent grass root prospecting returned numerous values up to 4.12 g/t gold on a grab sample (002306, Grenier, 2005) in a large meta sedimentary context combined with few weak As lake sediments anomalies.

The Virginia 2007 exploration program was designed to investigate the favourable geological context, review and extend the Au showings and verify As-Au-Cu-Pb-Zn lake sediment anomalies. The field work consisted of mapping, prospecting and rock sampling over the Nichicun property. A large till sampling campaign was simultaneously carried out to cover the entire Nichicun property and to outline new exploration targets.

This report provides the status of current technical geological information relevant to the latest Virginia Mines Inc. exploration program on the Nichicun project in Québec and has been prepared in accordance with the Form 43-101A1 Technical Report format outlined under NI-43-101. The report also provides recommendations for future work.

ITEM 5: DISCLAIMER

Co-author Louis Grenier, B.Sc. in Geology and Trainee Geologist for Virginia Mines has been involved in Nichicun project fieldwork campaigns (2004, 2005 and 2007). Co-author Mathieu Savard, B.Sc. in Resource Geology and Virginia's Project Geologist, reviews all projects and supervises all fieldwork conducted by Virginia Mines on its northern Quebec properties. Co-author Paul Archer, geological engineer with a M.Sc.A in Earth Sciences and Vice President, Exploration of Virginia is responsible for the design and is the qualified person for all Virginia's exploration programs.

ITEM 6: PROPERTY DESCRIPTION AND LOCATION

At the time of the field work, the Nichicun property was composed of four blocks of claims totalling 437 cells and covering approximately 223 km² in the James Bay area. At the end of December, Virginia consolidated its field position by joining the Nichicun northern block. 173 cells covering approximately 86 km² were added. The property is located 115 km SE of the LG-4 airport (James Bay) owned by Hydro-Quebec (Fig.1).

5 895 937 mN	

Refer to table appendix 4 for the list of claims and figure 2 and 3 for their location.

ITEM 7: ACCESSIBILITY, CLIMATE, LOCAL RESOURCES, INFRA-STRUCTURE AND PHYSIOGRAPHY.

The Nichicun project is located in the central part of the province of Quebec between the Caniapiscou reservoir to the northeast, the LG4 Hydro-Quebec installation to the west and the Mont Otish area to the south (Fig.1). Field operations were conducted from the Nichicun camp which is owned by Virginia Mines Inc. and located 90 km ESE of the LG-4 airport in the middle of the property. The camp and the property are only accessible by float- or ski-equipped aircraft

and by helicopter. Personnel and supplies were brought by road to Mirage Outfitter floatplane base, 106 km NW of the camp. Mirage is accessible by the all-season Trans-Taïga gravel road.

An Astar BA (Canadian Helicopters) was used for crew and material transport. All equipment, including fuel and supplies, were moved to Mirage Outfitter floatplane bases by truck and from there by airplane or helicopter to the campsites.

The landscape of the area is relatively flat with regions covered by low altitude rounded hills. Vegetation is typical of taiga including areas covered by forest with others, typically at the top of hills, devoid of trees. Large swamps occupy most of the valley area and the hydrographic network is well developed. At the 1: 250 000 scale, the La Grande and Sakami rivers are the major watercourses and substantial areas are occupied by large lakes (Amirault, Boisbriand, Joubert and Nichicun).

ITEM 8: HISTORY

8.1 Property ownership

The Nichicun project is wholly owned by Virginia Mines Inc.

8.2 Previous works

Table 2 summarises the exploration work performed in sheets 23E/ 03, 04, 05, 06, 33H/ 01, 08 and 09 to date.

Virginia Gold Mines Inc. (2002-2005)

- Numerous field programs including prospecting, mapping, geophysical surveys and drilling on MEP 1422, 1451 and 1421 (Noella) and surrounding area.

ITEM 9 : GEOLOGY

9.1 Regional geology

The following description of the regional geology is mainly taken from Gauthier (1996) and Lamothe (2000). The study area lies in the Superior Province at the junction of four lithotectonic domains, namely the Archean subprovinces of La Grande, Ashuanipi, Opinaca and Opatoca. The area is dominated by tonalites and granites hosting several Archean greenstone belts of kilometeric to deca-kilometric scale.

The main Nichicun block lies essentially in the Opinaca subprovince, composed of the Mercator formation (Lamothe, 2000). The large tonalitic intrusions belong to Tilly and the Joubert suites. The northern Nichicun block lies in the eastern part of the La Grand subprovince composed of the Dalmas formation (Lamothe, 2000).

A simplified description of the most abundant lithostratigraphic assemblages mapped during our exploration work is included below.

9.1.1 Dalmas formation

The Dalmas formation is part of the Duhesme group and is composed of medium grey to greenish brown coloured lithic meta wacke. The metasediment is a quartzo-felspathic schist with <20% biotite, <10% garnet and locally hornblende. Fine to medium grained, granoblastic textured,

migmatites are locally observed. The 5-20% of pegmatite leucosomes was made of centimetre to decimetre scale injections parallel to the main foliation.

Large iron formations were found in the metasedimentary sequence. They are medium- to dark-green coloured banded rocks composed of centimetre-scale quartz-rich bands interlayered with silicate-rich bands (Pict.1). The silicate bands are composed of hornblende, garnet, actinolite, grunerite and biotite. The volume of sulphide ranges from trace to 20% of the rock and usually consists of a large proportion of pyrrhotite and pyrite. Arsenopyrite and chalcopyrite are also observed in samples. The chert bands are aphanitic to fine-grained and granoblastic, whereas the silicate bands are characterised by medium- to coarse-grained, porphyroblastic texture. Garnet porphyroblasts up to 1 centimetres in diameter are also present.

Large amphibolite layers are also found in the metasedimentary sequence. The amphibolite is a black to dark-green coloured rock essentially composed of hornblende and plagioclase with various proportions of quartz, actinolite, garnet, biotite, phlogopite, sericite, calcite and epidote (Pict.2). Metamorphism has created a range of aphanitic to medium-grained and granoblastic textures. Primary textures have been obliterated by the amphibolite- to granulite- facies metamorphism and by the strongly-developed regional schistosity.

Small magnesian rich silts associated to the amphibolite have also been mapped (Pict.3). They are light green to reddish brown coloured rock essentially composed of pyroxene, tremolite, magnetite and talc. The centimetre scale phenocryst texture is also stretched in the main schistosity.

9.1.2 Mercator formation

The Mercator formation is a large metasedimentary sequence covering over 95% of the prospected territory. The metasedimentary sequence is overlapping the granitic and tonalitic basement of the Joubert suite in the north. The discordant contact is marked by the Dalmas thrust fault.

The metawackes are mainly composed of plagioclase, quartz and biotite in various proportion. Accessory minerals include Kspar, muscovite, garnet, hornblende and magnetite. Medium- to dark-grey coloured rock, because of the high metamorphic grade, the quartzo-feldspathic gneisses are generally coarse-grained and granoblastic textured. Granitic leucosomes with centimetric to decimetric thickness are omnipresent. Throughout the prospected area, the wacke is related to a paragneiss of sedimentary origin composed of 60-70% wacke and with 30-40% pegmatitic injections due to partial melting (Pict.4). The eastern part of the property is affected by a higher metamorphic grade than the western part. It is related to an increasing proportion of the partial melt moving eastward.

A second metawacke unit is included in the Mercator formation. It is characterized by the presence of 5-20% sillimanite and cordierite in its composition (Pict.5). Light brownish grey coloured, the aluminosilicates have a porphyroblastic texture. The lineation was easily identified by the strong elongation of the aluminosilicate crystals. This metawacke unit was discontinuous but can be followed over the entire property along two E-W trends, one in the north and the other

in the south. Usually of a 10-20 meters thickness, close to the SE showings it is reaching over 200 metres.

Small to large iron formations were found in the metasedimentary sequence. They are from silicate to oxide type. The silicate type iron formations have the same characteristics as the Dalmas formation's ones described previously. The oxide type iron formations are dark-bluish-green coloured banded rocks composed of centimetre-scale quartz-rich bands interlayered with magnetite-rich bands. Both, the chert bands and the magnetite bands are aphanitic to fine-grained.

Amphibolites are also mapped in a small area located in the centre of the property. They have the same characteristics as the Dalmas formation's ones described previously.

9.2 Local geology

The local geology is mainly taken from Alexis Ross-Gauthier observation's made during the field work 2007 and in his bachelor research project (in process). His work was focussed on the NW and the SE showings and includes a detail mapping, a characterization of the mineralization and a petrographic description based on macroscopic observations and on thin section descriptions. The characterization of the mineralization and the thin section descriptions will come later this year.

9.2.1 Geology of the NW Showing (Fig.4 and Pict.6)

9.2.1.1 S3, PG-QZ-BO-CL

Light grey coloured meta- wackes composed of 45% plagioclases, 30% quartz, 20% biotite and 5% chlorite. The schistosity is well developed with one millimetre scale biotite bands. The meta-wackes are fine grained (1-2 mm), homogenous and granoblastic textured. Late chlorite veinlets (3 mm width) are discordant to the main schistosity. Usually, no mineralization is observed. 15% of millimetre- to centimetre scale quartz veins cut the whole facies.

9.2.1.2 S3 (M4), SI+ PG-QZ-BO-CL-HB

Light grey coloured and altered meta- wake composed of 45% quartz, 25% plagioclases, 15% biotite, 10% hornblende and 5% chlorite. The schistosity is less developed than the previous facies. The biotite bands are less preserved and a strong penetrating quartz alteration (20 to 30%) characterized this facies. Large ,30 cm width, quartz-plagioclases veins composed the major part of the rock. The meta- wacke was granoblastic textured and no mineralization was associated to it.

9.2.1.3 S3 (M4), PG-QZ-BO-CL

Light-medium grey coloured meta- wacke rock composed of 50% plagioclases, 35% quartz, 13% biotite and 2% chlorite. The schistosity is well developed with 1-3 mm biotite bands showing the

beginning of the gneissosity and the mafic segregation. Principally at the amphibolite metamorphisme grade, the paragneiss are granoblastic textured. Quartz-plagioclases composed thin veins (2-6 mm) from partial melting origin are parallel to the schistosity. Biotite is concentrated in millimetre scale schlierens. Rare traces of mineralization, pyrrhotite, is observed.

9.2.1.4 S3, BO-QZ-PG-SR-CL-PO-PY

Light-medium grey coloured meta- wacke rock partially altered and composed of 35% biotite, 30% quartz, 15% plagioclases, 10% sericite, 5% chlorite and 5% sulphides. Foliated to schistous textured; the strong alteration hide the main deformation fabric. The metamorphism homogenised the whole rock with a granoblastic texture. The micas, sericite and biotite, make the penetrative potassic alteration. The mineralization is composed of millimetre- scale disseminated pyrrhotite and pyrite. The strong altered zone is 30 cm width and can be followed on all the facies length, over 200 meter. It includes numerous anomalous gold values.

9.2.1.5 S3 (M4), PG-QZ-BO-CL-HB, vnQZ+

Light-medium grey-greenish coloured meta- wacke rock composed of 35% plagioclases, 30% quartz, 25% biotite, 5% chlorite and 5% hornblende. The schistosity is well developed and millimetre- scale quartz veins cover 10% of the facies. The millimetre- scale biotite bands are concentrated in a 20 cm width zone. Generally homogenous and granoblastic textured without the occurrence of mineralization. Big quartz-plagioclases phenocrysts are stretched (1:3 ratio) in the orientation of the schistosity.

9.2.1.6 (M4), PG-QZ-BO-CL, vnQZ-

Same as the S3 (M4), PG-QZ-BO-CL facies described previously but with less quartz veins. The schistosity is less developed (may be ascribable to altered surface).

9.2.2 *Geology of the SE showings (Fig.5 and Pict.7)*

9.2.2.1 M4 (M22) \$, QZ-PG-BO-GR-MV-HB

Medium grey coloured and medium grained gneissic rock composed of 40% quartz, 25% biotite, 20% plagioclases, 7% garnets, 5% hornblende and 3% muscovite. The gneissic texture is pronounced by the strong schistosity development. The high grade metamorphism developed the mafic segregation characterized by the millimetre- scale biotite bands. Quartz vein are stretched and dislocated in the main deformation. Garnet alteration may be observed. Mineralization is composed by a low percentages of disseminated and millimetre- scale pyrite and arsenopyrite. The quartz vein is mainly composed of quartz and accessory minerals has 5% plagioclases, 5% garnets, 5% sulphides, 3% biotite and 2% tourmaline.

9.2.2.2 M4 (M22), QZ-PG-BO

Medium yellowish- grey coloured, medium grained paragneiss composed of 40% quartz, 35% plagioclases and 25% biotite. The schistosity is well developed and the meta- sedimentary rocks

have a granoblastic texture. 15 to 20% of quartz and plagioclases composed leucosome marked the high temperature metamorphism grade. Biotite schlierens are observed. Anatexic fold or poly- deformation pattern disturbed the main gneissosity. The biotite is weakly oxidized and gives a rusty colour. No mineralization is associated to this facies.

9.2.2.3 M8 QZ-PG-BO

Medium yellowish- grey coloured, medium grained schist of meta- sedimentary origin composed of 45% quartz, 35% plagioclases and 20% biotite. The gneissic texture of the previous facies is replaced by a strong schistosity (Pict.8). Millimetre- scale leucosomes formed 5% of the rock. The biotite bands are discontinuous and present in a proportion of 10%. The whole rock is folded. Weak oxidation alteration is observed.

ITEM 10 : DEPOSIT TYPE

This section is not applicable to this report.

ITEM 11 : MINERALIZATION

This section describes mineralized zones discovered during the summer of 2007 by prospecting and mapping. The location of the new mineralized boulders and showings is presented in figure 6 for the northern block area and figure 8 for the main block area.

Refer to appendix 1 for the summary of each described outcrop, appendix 2 for the list of abbreviations used for geological description and appendix 3 for the certificates of analysis.

11.1 Northern block area (Fig.6)

The gold potential of the northern block area is associated to a bi-modal volcanic context. Samples were collected in a metric scale altered contact between a felsic pyroclastite overlapping a thick mafic unit (Pict. 9). Two samples returned excellent gold values, **8.5 g/t and 2 g/t Au in grab sample (121747 and 121748 respectively)**. The contact can be followed over 500m and is still open in both direction.

The few days attributed to this area outlined a great potential of gold mineralization in a new favourable context. Others anomalous gold and silver values were obtained on outcrops and showings in the area. More investigation needs to be made.

Refer to table 2, table 3 and figure 7 for the grades and location of new mineralized outcrops and boulders.

Table 2 : Values obtained from outcrops on the northern block

Sample	Outcrop	Zone	Utm_E	Utm_N	Au g/t	Ag g/t	Cu%	Zn%	Ni%
121747	PM-NC-07-134	18	690547	5930352	8.5	1.7			
121748	PM-NC-07-135	18	690547	5930352	2.0	1.4			
121749	PM-NC-07-136	18	690547	5930352	0.4				
121975	MA-NC-07-065	18	688906	5932282	0.2				
121976	MA-NC-07-078	18	686143	5931899	0.4	3.7			

Table 3 : Values obtained from boulder prospecting on the northern block

Sample	Boulder	Zone	Utm_E	Utm_N	Au g/t	Ag g/t	Cu%	Zn%	Ni%
121973	MA-NC-07-051	18	692339	5933589	0.2				

11.2 Main block area (Fig.8)

The gold potential of the main block area is mainly associated to the large metasedimentary sequence wrapping a granodiorite to tonalite intrusion. Iron formation found in the paragneiss can also be a excellent context for gold mineralization.

The result are divided in two sections. The first section includes the new mineralized outcrops and the SE showings. The second section includes the results from the boulder prospecting and the geochemical survey. The result from the NW showing are presented in the channel sampling section discussed below.

11.2.1 Showings results

The best gold result obtained in the 2007 campaign is from the new discovered Scrou-Ten showing located in the NE area of the main block (Pict.10). Gold mineralization, **39.2 g/t Au in grab sample (121515)**, is associated to a arsenopyrite rich millimetre scale layer in a strongly metamorphosed metawacke. The entire rock is affected by anatexic folds. A limited channel sample was done (LG-NC-07-055, R-1 and R-2, Table 6) but did not return the same optimistic results. The deformation isolated meter scale shreds of iron formation or silicified wacke containing the mineralization (Pict.11). Another sample, 200m from the Scrou-Ten showing, returned **1.7 g/t Au in grab sample (121862)**. Even if few mineralized outcrops have been found in the area, the extension or the relation between each others is difficult to establish because the granitic leucosome usually occupied over 50% of the area.

At the SE showing, mineralization is associated to shredded decimetre scale quartz vein parallel to the main deformation. The re- sampling returned a value of **3.7 g/t Au in grab sample (121551)**. The prospecting was established to discover new veins in the vicinity of the previous one but the thick layer of overburden limited the work.

Refer to table 4 and figure 9 for the grades and location of new mineralized outcrops.

Table 4 : Values obtained from outcrops on the main block

Sample	Outcrop	Zone	Utm_E	Utm_N	Au g/t	Ag g/t	Cu%	Zn%	Ni%
121515	LG-NC-07-054	19	338188	5899278	39.2	24.8	0.10		
121516	LG-NC-07-054	19	338188	5899278	0.8	1.6

11.2.2 Boulders prospecting and geochemical survey (Fig.10)

The compilation of the mineralized boulders with the till sampling survey gives information on the area covered by glacial deposit and gives new exploration targets.

Sampled boulders are usually from iron formation or strongly altered paragneiss. They are visually identified by their rusty colour or found with the BeepMat. Their sulphide content is dominated by the pyrrhotite but trace of pyrite, arsenopyrite and chalcopyrite are also observed. A cluster of gold anomalous boulders was found up ice from the NW showing and returned values up to **0.8 g/t Au in grab sample (121659)**. This cluster is located in the up ice extremity of weak gold till dispersion pattern. Even if the NW showing is located in this pattern, the distribution of the boulder showed the potential of an other source for the gold dispersion pattern.

The till analysis outlined a new gold dispersion pattern in the middle of the property. Few work have been made in this area and the source still to be discovered.

Refer to table 5 and figure 9 for the grades and location of new mineralized boulders. Refer to figure 10 for the till location.

Table 5 : Values obtained from boulder prospecting on the main block.

Sample	Boulder	Zone	Utm_E	Utm_N	Au g/t	Ag g/t	Cu%	Zn%	Ni%

11.3 Channel samples (Fig.4 and 8)

A small channel sampling campaign was executed over the NW and the Scrou-Ten showings. Only few meter long channels were done from the Scrou-Ten showing to find the extension of the mineralization. The major part of the channel sampling program was made over the NW showing. 7 channels were cut perpendicularly of the mineralized band and spread over 200 meter long. The best values are associated to weakly silicified metawacke with trace to 2% sulphides. The pyrrhotite is the major sulphide but arsenopyrite is observed and is directly associated to the gold contain. The best value obtained is **0.6 g/t Au / 3 meters**.

Refer to table 6 for a summary of the description and the grade.

Table 6. Channel sample values over Nichicun property.

ITEM 12 : EXPLORATION WORK**12.1 Prospecting and geological mapping**

Prospecting and geological mapping was carried out from June 7th to July 4th 2007 on the main block and from July 16th to July 22th 2007 on the northern block. All geological data was collected by geologists Martin Aucoin, Louis Grenier, Joëlle Guérin, Philippe Morin and Alexis Ross-Gauthier assisted by Mario Bolduc, Caroll Désormeaux, Louis-David Durocher and Guillaume Lefrançois from Virginia Mines Inc. The work took 280 man/days (including mobilisation and demobilisation).

A total of 852 outcrops were described from which 178 samples were obtained. 169 additional rock samples were collected from boulders.

Prospecting surveys were done on selected targets in NTS 1:50 000 sheets 23E/03, 04, 05,06, 33H/01, 08 and 09. Based on the sample location, 80% of the total exploration cost are applicable to the claims.

12.2 Geochemical survey

The geochemical survey, till sampling campaign, was executed by Les Consultants Inlandsis Enr. The fieldwork was carried out from July 5th to July 15th 2007. All geochemical work was executed by a team of three workers under the supervision of Rémi Charbonneau, Project Geologist with a Ph.D. in earth science. It took, including the mobilisation and demobilisation, 30 man/days to execute the till sampling campaign.

A total of 200 till samples were picked up during the campaign. Each of these samples weight between 10.6 to 20,3 kilograms and were composed of till or sand and gravel.

The geochemical survey were done to cover the entire property in NTS 1:50 000 sheets 23E/03, 04, 05, 06, 33H/01 and 08. Based on the till sample location, 50% of the total exploration cost are applicable to the claims.

ITEM 13 : DRILLING

This section is not applicable to this report

ITEM 14 : SAMPLING METHOD AND APPROACH**14.1 Rock Samples**

Rock samples collected during the 2007 reconnaissance program were obtained to determine the elemental concentrations in a quantitative way by ALS Chemex, Val d'Or. These included both mineralized and barren rocks, the latter of which were selected for lithological controls. Samples

were collected at the bedrock surface by either a hammer or a saw at sub-surface. All the collected samples were located with the use of a GPS instrument. Samples from the trench were positioned relative to one other using the GPS position of the trench.

For surface sampling, most of the weathered crust was removed before samples were bagged. All samples were placed in individual bags with their appropriate tag number and the bags were sealed with fibreglass tape. Individual bagged samples were then placed in shipping bags. The authors are not aware of any sampling or recovery factors that would impact the reliability of the samples.

14.2 Till samples

Till samples collected during the 2007 till sampling campaign were obtained to determine the quantities of total, reshaped, modified and pristine gold grains by Overburden Drilling Manager, Nepean Ontario. After this analyse, the concentrated part was send to ALS Chemex, Val d'Or, for the elemental concentration in a quantitative way analysis (in process). Samples have been collected on the overburden deposit by digging with a shovel to the appropriate horizon and they all have been located with the use of a GPS instrument.

All samples were placed in individual bags doubled by caution and tagged with their appropriate number. Bags were sealed with fibreglass tape or with plastic tie straps. The authors are not aware of any sampling or recovery factors that would impact the reliability of the samples.

ITEM 15 : SAMPLE PREPARATION, ANALYSIS AND SECURITY

15.1 Sample security, storage and shipment

Samples were collected and processed by the personnel contracted by Virginia. They were immediately placed in appropriates sample bags, tagged and recorded with unique sample numbers. Rocks sealed samples were placed in shipping bags, which in turn were sealed with plastic tie straps or fibreglass tape. Bags remained sealed until the ALS Chemex Val-d'Or or Overburden Drilling Management personnel opened them.

All samples were initially stored at the campsite. Samples were not secured in locked facilities, this precaution deemed unnecessary due to the remote location of the camp. Rocks samples were then loaded onto a pickup truck for transport to Val-d'Or where Virginia personnel delivered them to the ALS Chemex sample preparation facility.

15.2 Sample preparation and assay procedures

15.2.1 Rock samples

After logging in, the samples were crushed in their entirety at the ALS Chemex preparation laboratory in Val-d'Or to >70% passing 2 mm (ALS Chemex Procedure CRU-31). A 200- to 250-g sub-sample was obtained after splitting the finer material (<2 mm). The split portion

derived from the crushing process was pulverized using a ring mill to >85% passing 75 µm (200 mesh - ALS Chemex Procedure PUL-31). From each such pulp, a 100-g sub-sample was obtained from another splitting and shipped to the ALS Chemex laboratory for assay. The remainder of the pulp (nominally 100 to 150 g) and the rejects are held at the processing lab for future reference. The AU + SCAN analytical packages have been used.

The Au + SCAN package includes Au, Ag, Al, As, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, K, Mg, Mn, Mo, Na, Ni, Pb, S, Sb, Sc, Sr, Ti, V, W, and Zn. All elements, except Au, were determined by the ME-ICP41 Procedure. Au was determined by the AA23 Procedure. For the sample with the value higher than 10 g/t Au, the analysis was repeated with the GRA21 Procedure.

15.2.2 Till samples

The Overburden Drilling Management Ltd. laboratory processed the till samples for gold grain count using shaking table concentration only. No heavy liquid refining was used.

After logging in, the samples are identified, organized and weighted at the Overburden Drilling Management Ltd. laboratory in Nepean, Ontario. Sample were splitted and one fraction (350g) of each sample is stored as a original sample protection process. The other split portion is sieved to a fraction sized inferior to 2 millimetre. The split portion larger than 2 millimetre is weighted and archived. The fraction left is concentrated with the separation table method and micropanning method if required. During this step each sample was characterized and visible gold grain count was effectuated. The calculate assay value is effectuated as the last step of the processing sequence. The ultimate concentrated fraction is weighted and archived for future verification.

The ALS Chemex laboratory process the till sample for the elemental concentration in a quantitative way analysis. The ALS Chemex laboratory received he fraction of sample sized inferior to 2 millimetre obtained by Overburden Drilling Management Ltd laboratory. From there, sample are treated similarly has the rock samples and analysed for the AU + SCAN packages described previously.

ITEM 16 : DATA VERIFICATION

Due to the relative grassroot nature of the exploration program, rigorous data verification procedures were not deemed necessary. The authors were involved in the collecting, recording, interpretation and presentation of data in this report and the accompanying maps. The data has been reviewed and checked by the authors and is believed to be accurate. ALS Chemex, as part of their standard quality control, ran duplicate check samples and standards. No sample was assayed at other laboratories. It is considered somewhat less important in grassroot projects, which are generally characterized by small batches of unmineralized to weakly-mineralized samples.

ITEM 17 : ADJACENT PROPERTIES

This section is not applicable to this report.

ITEM 18 : MINERAL PROCESSING AND METALLURGICAL TESTING

This section is not applicable to this report.

ITEM 19 : MINERAL RESOURCE, MINERAL RESERVE ESTIMATES

This section is not applicable to this report.

ITEM 20 : OTHER RELEVANT DATA

This section is not applicable to this report.

ITEM 21 : INTERPRETATION AND CONCLUSIONS

280 man/days were spent prospecting, sampling and mapping different targets derived from Au-As-Cu-Pb-Zn lake sediment anomalies, occurrences of potentially-favourable lithologies and positive results obtained during the previous campaign. 30 man/days were added for a geochemical survey covering the entire property.

The summer 2007 reconnaissance campaign on the Nichicun property confirms the potential of Au mineralization on the main block area and discovered a new gold favourable context on the northern block area..

The new **8.5 g/t Au** discovery on the northern block area outlined the potential of gold mineralization associated to the felsic and volcanic rock. The alteration, the deformation and the shallow dipping layering angle may be associated to a major thrust fault. The extension of this favourable horizon is known over 500 meter and still open in all directions.

On the main block, mapping and prospecting around the NW showing extended the favourable altered metawacke layer over 200 meter. Even if the channel sampling campaign did not return high grade results, the anomalous gold content confirmed the gold potential of the paragneiss. On the the SE showing, mineralization is associated to strongly deformed shreds of quartz vein. No others veins have been discovered and theirs discontinuity makes them hard to follow.

The new Scrou-ten showing, **39.2 g/t Au**, is located in a high metamorphosed area. The mineralization is associated to small windows of altered paragneiss or iron formation floating in a granitic leucosome. Again in this case, the high deformation level and their discontinuity make them hard to follow.

The compilation of the geochemical till survey and the boulder data confirmed the gold potential of the NW showing and extended the favourable context to the NE. The boulders discovered in

this area can not come from the NW showing and their sources is still to be found. Another potential area was outlined by the geochemical survey. Located in a weakly explored area, the gold source is still to be discovered.

ITEM 22 : RECOMMANDATIONS

Interesting results were obtained during the 2007 reconnaissance campaign and further work is proposed. Prospecting and mapping should be effectuated on the northern area favourable mineralized contact. More work should be done in the NW showing area and in an up ice direction to find the source of the gold trend in the till. For the new gold trend discovered in the middle of the main block, prospecting and mapping supported by another till survey could be undertaken.

Because of the high deformation, high metamorphism and their low volume potential, the Scrou-Ten area and the SE showing could be a second priority target for further exploration campaign. Because of the quaternary coverage, mechanical trenching would be necessary to improve the understanding and the potential of the SE showing area.

ITEM 24 : DATE AND SIGNATURES PAGE

CERTIFICATE OF QUALIFICATIONS

I, *Mathieu Savard*, resident at 109 Chemin des Mélèzes, Lac Beauport, Qc, G3B 2B5, hereby certify that:

- I am presently employed as a Senior Geologist with Virginia Mines inc., 116 St-Pierre, Suite 200, Québec, Qc, G1K 4A7.
- I have received a B.Sc. in Geology in 2000 from the Université du Québec à Montréal.
- I have been working as a geologist in mineral exploration since 1997.
- I am a professional geologist presently registered to the board of the *Ordre des Géologues du Québec*, permit number 510.
- I am a qualified person with respect to the Nichicun Project in accordance with section 5.1 of the national instrument 43-101.
- I supervised the Nichicun project from June to August 2007.
- I am responsible for writing the present technical report in collaboration with the other author, utilizing proprietary exploration data generated by Mines Virginia inc. and information from various authors and sources as summarized in the reference section of this report.
- I am not aware of any missing information or changes, which would have caused the present report to be misleading.
- I do not fulfill the requirements set out in section 5.3 of the National Instrument 43-101 for an «independant qualified person» relative to the issuer being a direct employee of Mines Virginia inc.
- I have been involved in the Nichicun project since 2007.
- I have read and used the National Instrument 43-101 and the Form 43-101A1 to make the present report in accordance with their specifications and terminology.

Dated in Québec, Qc, this 30th day of January 2008.

"Mathieu Savard"

Mathieu Savard, B.Sc., P. Geo.

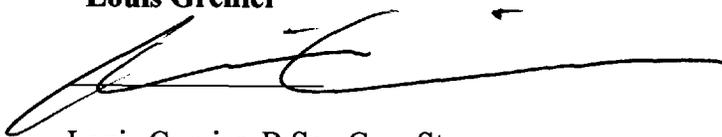

CERTIFICATE OF QUALIFICATIONS

I, *Louis Grenier*, resident at 88 E#4 Chemin du Lac Brochet, St-David-de-Falardeau, Qc, G0V 1C0, hereby certify that:

- I am presently employed as Geologist in training with Virginia Mines inc., 116 St-Pierre, Suite 200, Québec, Qc, G1K 4A7.
- I have received a B.Sc. in Geology in 2003 from the Université Laval.
- I have been working as a geologist in training in mineral exploration since 2001.
- I am a geological in training presently registered to the board of the *Ordre des Géologues du Québec*, permit number 800.
- I am not a qualified person with respect to the Nichicun Project in accordance with section 5.1 of the national instrument 43-101.
- I visited the region in August 2004, September 2005, and from June to August 2007.
- I am responsible for writing the present technical report in collaboration with the other author, utilizing proprietary exploration data generated by Mines Virginia inc. and information from various authors and sources as summarized in the reference section of this report.
- I am not aware of any missing information or changes, which would have caused the present report to be misleading.
- I do not fulfill the requirements set out in section 5.3 of the National Instrument 43-101 for an «independant qualified person» relative to the issuer being a direct employee of Mines Virginia inc.
- I have been involved in the Nichicun project since 2004.
- I have read and used the National Instrument 43-101 and the Form 43-101A1 to make the present report in accordance with their specifications and terminology.

Dated in Québec, Qc, this 30th day of January 2008.

"Louis Grenier"

Louis Grenier, B.Sc., Geo. Stag.

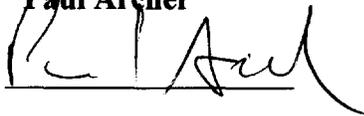

CERTIFICATE OF QUALIFICATIONS

I, *Paul Archer*, resident at the 4772 rue du Courlis, St-Augustin-de-Desmaures, Qc, G3A 2B5, hereby certify that:

- I am presently the Vice President, Exploration with Mines Virginia inc., 116 St-Pierre, Suite 200, Québec, Qc, G1K 4A7.
- I received a B.Sc. in Geological Engineering from the Université du Québec à Chicoutimi in 1979 and a M.Sc.A. in Earth Sciences from the Université du Québec à Chicoutimi in 1982.
- I have been working as a professional geologist in exploration since 1980.
- I am an active professional engineer in geology presently registered to the board of the *Ordre des Ingénieurs du Québec*, permit number 36271.
- I am a qualified person with respect to the Trieste Project in accordance with section 5.1 of the national instrument 43-101.
- I have already visited the immediate region where the exploration activities were undertaken.
- In collaboration with the other two authors, I have supervised the preparation and edited all sections of this report utilizing proprietary exploration data generated by Virginia Mines inc. and information from various authors and sources as summarized in the reference section of this report.
- I am not aware of any missing information or change, which would have caused the present report to be misleading.
- I do not fulfill the requirements set out in section 5.3 of the National Instrument 43-101 for an «independant qualified person» relative to the issuer being a direct employee of Virginia Mines inc.
- I have been involved in the Nichicun project since 2004.
- I read and used the National Instrument 43-101 and the Form 43-101A1 to make the present report in accordance with their specifications and terminology.

Dated in Québec, Qc, this 30th day of January 2008.

Appendix 2. List of abbreviations used for geological description, Nichicun project

List of minerals [taken from MB 96-28 document MRN-Québec, Sharma (1996)]

AC	Actinolite	GL	Galena
AD	Andalusite	GP	Graphite
AL	Aluminosilicate	GR	Garnet
AM	Amphibole	HB	Hornblende
AS	Arsenopyrite	KN	Kyanite
AT	Anthophyllite	MG	Magnetite
BL	Beryl	MO	Molybdenite
BN	Bornite	MV	Muscovite
BO	Biotite	OX	Orthopyroxene
CB	Carbonate	PD	Pentlandite
CC	Calcite	PG	Plagioclase
CD	Cordierite	PH	Phlogopite
CG	Cummingtonite	PO	Pyrrhotite
CL	Chlorite	PX	Pyroxene
CM	Chromite	PY	Pyrite
CP	Chalcopyrite	QZ	Quartz
CR	Chloritoid	SF	Sulfures
Cu	Native copper	SM	Sillimanite
CX	Clinopyroxene	SP	Sphalerite
DP	Diopside	SR	Sericite
EP	Epidote	ST	Serpentine
FK	K-Felspar	TC	Talc
FL	Fluorine	TL	Tourmaline
FP	Felspar	TM	Tremolite

List of textures [taken from MB 96-28 document MRN-Québec, Sharma (1996)]

AP	Aphanitic	GT	Very-fine grained
BR	Breccia	HJ	Homogenous
BT	Tectonic breccia	LA	Laminated
CS	Sheared	LS	Leucosome
CO	Pillowed	LX	Leucocrate
DQ	Diabasic	MA	Massive
EN	Float	MX	Melanocrate
FO	Foliated	MZ	Mobilisat
GB	Glomeroblastic	PG	Pegmatitic
GS	Gneissic	PO	Porphyritic (ú)
GF	Fine-grained	PQ	Porphyroblastic (ý)
GG	Coarse-grained	RU	Banded
GM	Medium-grained	SC	Schistosed
GO	Very coarse-grained	TL	Lapilli tuff
GR	Granoblastic		

Types of lithologies [taken from MB 96-28 document MRN-Québec, Sharma (1996)]

Sedimentary rocks

S1	Sandstone
S2	Arenite (Biotite <15%)
S3	Wacke (Biotite >15%)
S4	Conglomerate
S9	Iron formation (A: Undetermined; B: Oxide; D: Silicate; E: Sulphide)
S11	Exhalite
VQZ	Quartz Veins

Volcanic rocks

V1B	Rhyolite		
V1C	Rhyodacite		
V1D	Dacite		
V2J	Andesite	I1B	Granite
V3A	Andesitic basalt	I1C	Granodiorite
V3B	Basalt	I1D	Tonalite
V4A	Komatiite	I1G	Pegmatite
V4B	Pyroxenitic komatiite	I2D	Syenite
V4C	Peridotitic komatiite	I2E	Quartz monzonite

Intrusive rocks

Metamorphic rocks

		I1M	Monzo-granite
		I2F	Monzonite
		I2I	Quartz diorite
M1	Gneiss	I2J	Diorite
M3	Orthogneiss	I3A	Gabbro
M4	Paragneiss	I3B	Diabase
M8	Schist	I3Q	Gabbronorite
M12	Quartzite	I4A	Hornblendite
M16	Amphibolite	I4B	Pyroxenite
M21	Diatexite	I4I	Peridotite
M21A	Anatectic granite	I4N	Serpentinite
M22	Migmatite		
T2	Mylonite		
T4	Tectonic breccia		

Appendix 3. Certificates of analysis

CERTIFICAT VO07071369

Projet: NICHICUN

Bon de commande #:

Ce rapport s'applique aux 3 échantillons de roche soumis à notre laboratoire de Val d'Or, QC, Canada le 6-JUIL-2007.

Les résultats sont transmis à:

PAUL ARCHER

MATHIEU SAVARD

PRÉPARATION ÉCHANTILLONS

CODE ALS	DESCRIPTION
WEI-21	Poids échantillon reçu
LOG-22	Entrée échantillon - Reçu sans code barre
CRU-31	Granulation - 70 % <2 mm
SPL-21	Échant. fractionné - div. riffles
PUL-31	Pulvérisé à 85 % <75 um

PROCÉDURES ANALYTIQUES

CODE ALS	DESCRIPTION	INSTRUMENT
S-IR08	Soufre total (Leco)	LECO
PGM-ICP23	Pt, Pd et Au 30 g FA ICP	ICP-AES
ME-XRF06	Roche totale - XRF	XRF
OA-GRA06	Perte par calcination pour ME-XRF06	WST-SIM
Ag-AA61	Trace Ag - direction quatre acides	AAS
Co-AA61	Trace Co - Digestion quatre acides	AAS
Cu-AA61	Trace Cu - Digestion quatre acides	AAS
Ni-AA61	Trace Ni - Digestion quatre acides	AAS

Bon de commande #:

Ce rapport s'applique aux 89 échantillons de roche soumis à notre laboratoire de Val d'Or, QC, Canada le 2-AOUT-2007.

Les résultats sont transmis à:

PAUL ARCHER

MATHIEU SAVARD

PRÉPARATION ÉCHANTILLONS

CODE ALS	DESCRIPTION
WEI-21	Poids échantillon reçu
LOG-22	Entrée échantillon - Reçu sans code barre
CRU-31	Granulation - 70 % <2 mm
SPL-21	Échant. fractionné - div. riffles
PUL-31	Pulvérisé à 85 % <75 um
CRU-QC	Test concassage QC

FILE NO: STG - Ouellette - (NC07) - Aug 2007
SAMPLE NUMBERS: NC07-001 to 040
BATCH NUMBER: 3837
TOTAL SAMPLES: 40
THESE SAMPLES WERE PROCESSED FOR: GOLD GRAIN COUNT
HMC

RESU LE
18 OCT. 2007

SPECIFICATIONS:

1. Submitted by client: ±15 kg till and sand & gravel samples.
2. Larger pebbles removed by hand in the field.
3. Heavy liquid separation specific gravity: 3.30.
