INTRODUCTION

This report summarizes the Otish Uranium Project 2007 field exploration program located in the central part of Québec, within Archean basement rocks as well as within the meso-proterozoic Otish Sedimentary Basin. The prospecting activities were spread over a large land package consisting of 5 separate claim blocks covering 972 claims held by the Melkior Resources Inc. - Santoy Resources Ltd. joint venture.

This prospecting program began on June 1rst 2007 and lasted until August 31rst. A total of four prospecting crews were hired along the prospecting activities, where two crews, consisting of 2 prospectors per crew, were alternatively on duty. These prospecting crews were under the supervision of Michel Roby géo., the writer of this report.

Our mandate was basically to organize and supervise the uranium prospecting activities and to compile the field data's as well as the assay results for future evaluation and follow-up campaign.

The prospecting program can be divided into three different sequences being:

- 1- Marc-André - J. Robert area, where the prospecting activities were concomitant with the diamond-drilling activities over that same claim block.
- 2- Ground radiometric prospecting over the total area of the land package, prior to the completion of a mag-spectro aerial survey.
- 3- Mag-spectro target follow-up on the Laparre claim block.

That prospecting program has been hampered due to the late execution of an aerial geophysical survey that generated some radiometric targets only around mid-August. Other causes that contributed to the hampering of this program were, the bad weather causing the crews to be grounded at camp site for several days when no flying was possible over the Otish Mountains and, a helicopter crash that took the life of the pilot Kristina Raymond. That later event resulted in a loss of 5 day before another helicopter was available.

A total of 306 samples were collected from the five different claim blocks and were sent for analysis at the SRC labs in Saskatchewan. It is recommended to submit these assay results to a uranium exploration oriented geochemist to be analyzed in order to find pathfinder elements that would indicate local alteration haloes and generate follow-up targets.

LOCATION AND ACCESS

The Otish Uranium Project is located in the central part of the Québec Province, where it covers an area of 677 square km and it is spread over five different claim blocks. These five blocks are found within a perimeter of 175 km by 56 km, centered on NTS sheet 23D03. The nearest mining town, Chibougamau, is located 275 km to the south-southwest.

These claim blocks are only accessible by floatplane and helicopter. The nearest air base, Big River Air Services, is located on the shore of Lake Témiscamie, 120 km to the south.

The first crews, camp logistics and the drillers as well as their material and equipments were mobilized to the campsite directly from Chibougamau, with Big River Air Services, using a Caravan plane on wheel. At this time, a graveled air-strip, 5 km SSE of the campsite, was available, being used by another air carrier to provide air transportation services to Strateco Resources Inc., whose are developing their nearby Matoush uranium prospect. Later on, the Témiscamie air base was used as our dropping point for manpower and material transportation to the campsite. Floatplanes were then used and, Placer Lake, 5 km north from the Eastmain camps, was our landing site from where the material or persons were carried to the camps by helicopter. Another lake, named 20km Lake, located some 20 km SSW of the campsite, along the winter road, was also used as landing site when meteorological conditions were not convenient for safe landing on Placer Lake. The graveled airstrip could not be used after the break-up, its surface being too soft to land with wheel-float gear.

During the drilling program, an Astar 350-B2 helicopter was chartered from Heli-Transport Inc., while a Hughes MD500D was retained from the same provider for the prospecting activities after the drilling program was completed.

The Eastmain Mine camp facilities were rented from Eastmain Mines Inc. on a monthly basis, where the Melkior-Santoy joint venture was responsible for the refurbishing and the maintenance of the equipments.

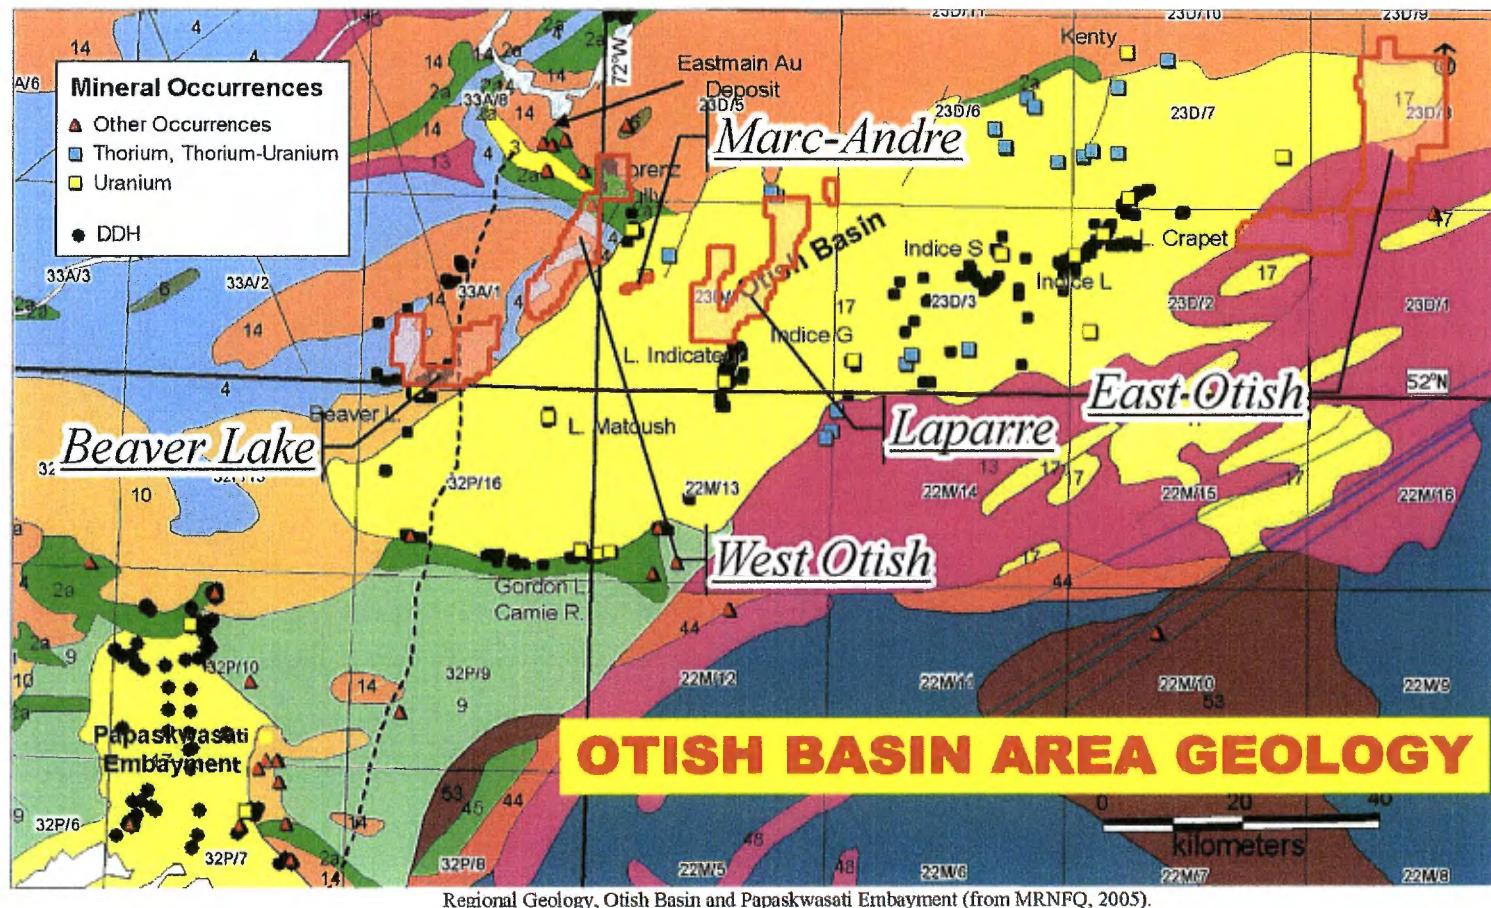

Fig. 2- Melkior-Santoy claim blocks within Otish Sedimentary Basin (yellow) and surrounding Archean basement rocks.

OTISH URANIUM PROJECT GEOLOGICAL CONTEXT

According to Mr. Serge Genest, the writer of a thesis on the Otish Basin, the Otish basin represents the largest area in Québec, in terms of geological province favorable to uranium discoveries. He states that the Formations of most interest are those that belong to the Lac Indicateur group and the units at the base of the Basin where clastic sediments containing quartz pebbles are found in discordant contact with the Archean basement rocks, that is promising for gold and uranium.

The mineralization generally occurs along the margins of faults in a highly fractured and altered environment adjacent to vertical gabbro dykes emplaced within the fault zone. The uranium mineralization found at Matoush lies well above the basin rim and resembles "Perched bodies" similar to the McArthur River and Cigar Lake uranium deposits in the Athabasca basin. The most common uranium mineralization in the Otish Basin is epigenetic with a dominant structural control. The best examples are the Matoush showing in the west central part of the basin (currently owned by Strateco), and the Beaver Lake showing (owned by Uranerz, now COGEMA).

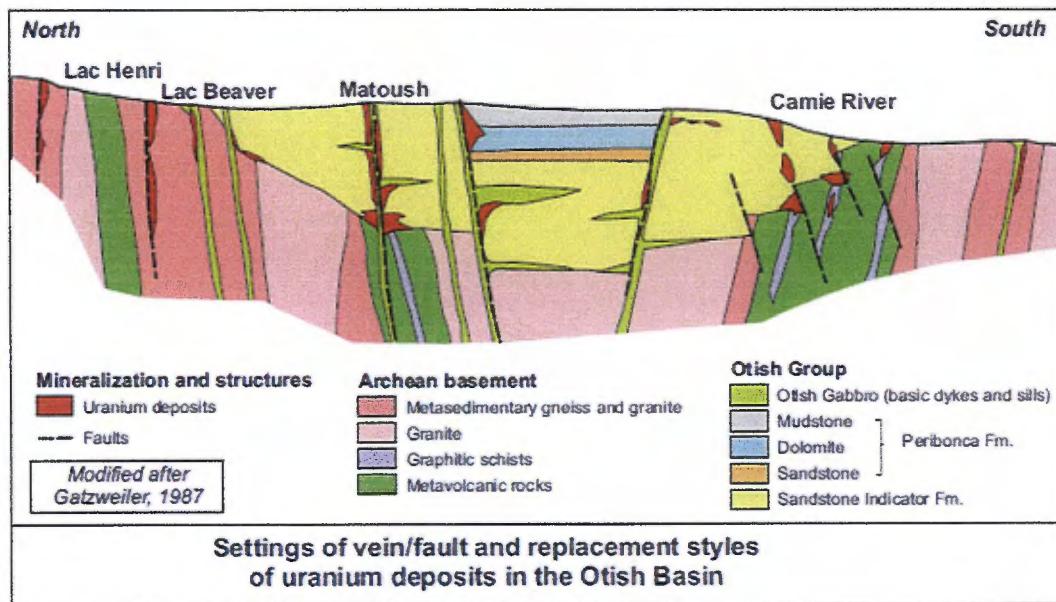

Fig. 3- Different styles of mineralization found in the Otish Basin and surrounding Archean basement rocks.

PROSPECTING AND ANALYSIS CHARACTERISTICS

The prospecting activities were directed at the finding of radioactive boulder fields or outcropping areas, with the goal to locate uranium bearing lithologies or structures. For that purpose, the prospecting crews were using either a McPhar TV 1 or the Exploranium GR-110 hand-held scintillometers. These instruments measure the local radiation level and gives numerical values that can be recorded by the prospectors. The prospecting crews were asked to put an emphasis on the finding and sampling of angular boulders or anomalously radioactive lithologies. The prospecting crews were generally composed of two prospectors with their proper scintillometer and GPS to record the position of the collected samples. The samples were bagged and tagged during field operations and, a flagging was tied near the sampling site with the inscription of the corresponding sample number. The samples collected by the different prospecting crews were examined by the geologist at the campsite before they were put in transport bags to be sent for analysis at SRC Labs in Saskatchewan. The bagged samples were generally transported by a member of the prospecting crews to Val-d'Or, from where it was sent to the SRC Labs by an inter-provincial carrier.

All the samples submitted to SRC Labs were analysed following a Santoy Resource's regular ICP method.

Sample Receipt and Preparation

All samples are received and entered into the Laboratory Information Management System (LIMS). A chain of custody is established at this point. All analytical data which is generated during the analysis of samples is the property of the customer and shall be controlled by QA measures at the laboratory.

Rock samples were dried in the original plastic bags @80C overnight, then jaw crushed to 60% -2mm and 100-200g sub sample split out using a riffler. The sub sample was pulverized to 90% - 106 microns using a puck and ring grinding mill. The grinding mills were cleaned between samples using steel wool and compressed air or the case of clay rich samples, silica sand cleaning was employed. The pulp was transferred to a labelled plastic snap top vial.

Sample Analysis/Testing Overview

The samples are tested using validated documented procedures by trained personnel. All samples are digested prior to analysis by ICP. Two separate digestions were preformed: Partial and Total.

ICP-OES: Multi element on partial and total digestion:

Two separate analyses were done for the partial and total digestions. Instruments were calibrated using certified commercial solutions. The instruments used were PerkinElmer Optima 300DV, Optima 4300DV or Optima 5300DV.

Table 1: Detection Limits:

Partial Digestion		Total Digestion							
Ag	0.1 ppm	Al ₂ O ₃	0.01%	Ag	0.2 ppm	Li	1 ppm	W	1 ppm

Zn	0.1 ppm			La	1 ppm	V	1 ppm		

Sample Preparation: Digestions

Total:

Total Digestions were performed on an aliquot of sample for the analysis of the requested elements by ICP.

A 0.25g aliquot of pulp was digested to dryness in a Teflon beaker using a hotplate in a mixture of concentrated HF:HNO₃:HClO₄. The residue was dissolved in 15 ml of dilute HN0₃.

Partial:

Partial Digestions were performed on an aliquot of sample for the analysis of the requested elements by ICP.

A 2g aliquot of pulp was digested in a digestion tube in a mixture of HNO₃:HCl, in a hot water bath for approximately 1 hour, then diluted to 15ml using deionized water.

SRC Geoanalytical Laboratory Quality Control

All Quality Control data generated at SRC Geoanalytical Laboratory is reviewed by the Quality Assurance Specialist. The Quality Control Techniques used for verifying all results generated include:

- **Data verification:**

At least 2 levels of data verification performed prior to reporting results.

- **Instrument Calibration:**

All instrumentation is maintained and calibrated prior to sample analysis. This is to ensure the stability of the instrument during analysis.

- **Analysis of Blanks:**

A digested blank sample is analysed by the same procedure as normal samples along with the sample group to ensure that there is no contamination from the sample preparation.

- **Analysis of duplicates:**

One sample preparation and analysis is duplicated with each group of samples to ensure that the repeatability of the results generated. All duplicate analysis must be within specified limits.

- **Analysis of reference (QC) samples:**

Various QC samples are analysed with each group of samples and are used to monitor analytical performance. The results of QA analysis is charted using control charts/compare program on LIMS.

MARC-ANDRÉ CLAIM BLOCK

The first phase of prospecting was carried over the Marc-André claim block, where exploration works by previous owners (Uranerz Exploration and Mining Ltd.) led to the discovery of an uranium occurrence named the Marc-André showing and, a uraniferous block train referred to as the Jean-Robert block train. That claim block is composed of 16 claims within the 23D04 NTS sheet, of which 10 have irregular forms less than 16 ha.

The prospecting works were executed concomitantly with a diamond drilling program, that is the subject of a different report, and which was supervised by the writer of this report.

One geologist, Mr. Brian Willet, and one prospector, Mr. Cecil Barrett, from Santoy Resources Inc. have spent four days on the site, training the native prospecting crew on the basics of prospecting for uranium with a McPhar TV 1 scintillometer. That native prospecting crew was composed of Andrew Blacksmith (father) and Andrew Blacksmith (son). After a week or so, the father decided he was not fit for this type of work. He was then replaced by Christopher Blacksmith, which was replaced by Charles Matches later on.

Even though the radiometric anomalies were very scarce outside the Marc-André showing and the Jean-Robert block train area, Mr. Willett has produced a detailed description of the area and the mineralization observed.

Notes from Mr. Willet report:

The Marc-Andre showing consists of 3 closely spaced "trenches" with spotty elevated radioactivity associated with a contact zone between the gabbro and quartzite to quartz arenite in Trench 1, and very thin (10 to 50 cm thick) discordant fine grained hematized dykes (?) in contact with the sediments in Trenches 2 and 3. Trenches 2 and 3 are actually scarps that have been stripped off to the bedrock. The best numbers recorded gave T1=65,000; T2=8,000, and T3=90. So there appears to be Thorium and K associated, I guess. Associated alterations seen in trenches are tourmaline and fuchsite.

Also went to the J. Robert uraniferous block train and located roughly 20 radioactive gabbroic boulders. These boulders do not resemble the mineralization at the Marc-André occurrence. The boulders are fine-grained gabbro to diabase that are crosscut by millimeter scale ferromagnetic bands that might carry the U. The only significant alteration of note is moderate hematization, and this is associated with only a few of the boulders. Some of the boulders are amphibolitized mafic intrusives. One boulder ran T1 greater than 100,000, T2=6,000 and T3=200. Many of the boulders returned

greater than 10,000 cps using the Exploranium GR-110 scintillometer. Three of the boulders have been collected for assay (Samples 206551 to 206553).

The boulders form a thin ribbon that is probably 200 meters long; there doesn't appear to be a fan-type dispersal associated, suggesting that the source may be narrow (?) and at least sub-parallel to ice direction (just my thoughts). They occur within and on top of a wide train of dominantly quartzite boulders. Many of the radioactive gabbro boulders are sub-angular to angular. A 1 meter deep pit was dug within the boulder ribbon. The till is characterized by the gabbro boulders which sit on top of quartzite boulders which in turn overlie a sandy till.

Prospecting of the magnetic structure and mag breaks associated with the gabbro between the Marc-Andre showing and Line 15 West confirmed the general stratigraphy as per the Marc-Andre showing, but did not results in the discovery of any major radioactive zones. A small radioactive area was located within quartzite near the sediment/gabbro contact near the baseline at Line 2 West. The mineralization is roughly coincident with an east-west break in the mag.

Apart from the basic field prospecting, a stripping of the trench # 1 over the Marc-André showing was executed to try to explain the relations between the uraniferous mineralization, the local lithologies and alteration pattern. During that last phase of works, Gaetan Roby and Guillaume Roby were replacing the native prospecting crew.

The geological mapping of the stripped area has permitted to observe that the anomalous radiometric readings are located within the gabbroic intrusive, where it appears to be related to a set of fractures sub perpendicular to the gabbro-quartzite contact and that the mineralized zone is very local. A detailed scintillometer survey at 0.30m spacing over the stripped area resulted in the definition of a highly anomalous area roughly 1,0 X 4,0m. where the McPhar TV 1 readings vary between 60 000 to over 100 000 CPS.

A channel sample was taken across the anomalous zone where 7 samples were collected over a distance of 2,20m (Samples 206554 to 206560).

About tens meters to the S-W, another area measuring 4,0 X 4,0m (Stripping # 1-S) has been stripped to observe the local features associated to a zone of weak to moderate spotty radiometric anomalies. The McPhar TV 1 readings vary from 4000 to 53000 cps, with the highest values having a very local distribution. Three samples were collected from that stripped area (206561, 206562 and 206651). That site has not been mapped in detail due to intense weathering that did not permit to explain the nature of the lithologies and radiometric anomaly.

The results of the prospecting activities over the Marc-André claim block has not led to the finding of other anomalous radiometric areas except for a weakly anomalous zone around BL 2+00 / 0+30 S where an hematized arenitic quartzite unit returned a weak scintillometer response. However, it must be stated that outcrops are relatively restricted to the gabbroic dyke and that almost 70% of the claim block is occupied by relatively wet ground

The stripping of the trench # 1 area has not permitted to clearly identify the control of the uraniferous mineralization where it appears to be fracture controlled. The green alteration pattern (fuchsite?) does not appear to be related to the local uraniferous zones, as it is relatively widespread compare to the distribution of the radiometric anomaly.

Other zone of radiometric activity (Trench # 2 and # 3) appears to be associated to a concordant hematite rich quartz-arenite layer. This later concordant anomalous style of mineralization has also been observed further E-N-E, in northern part of the LaParre Claim Block.

The source of the J-Robert uraniferous block train has not been traced due to a large zone of fluvio-glacial deposit up-ice from the uraniferous boulder train. From the deduction of the field prospecting, that source must be somewhere relatively close, the dispersion of the anomalous boulders having a linear pattern. The other explanation for this pattern would be a relatively thin mineralized zone oriented parallel to ice movement.

Overall, a total of 41 samples were collected over the Marc-André claim block. A list containing a description of the samples with their location is included further in this report and, the analysis results are included in the assay results appendix.

B. Willett (Marc-André / J. Robert) Field notes

Waypoint	Easting	Northing	Sample #	Radiometrics (cps)			Outcrop (O) Boulder (B)	Description	Bedding (RHR)	Fault plane	Joints
				GR-110	T1	T2					
Marc-André Showing Prospecting											
74	301702	5781184					Outcrop	Quartz arenite	200/8		
								Trench 2: grey-cream quartzite to quartz arenite; similar strike dip as per 74. Several discordant fine grained maroon coloured sed(?) units from 10 to 40 cm thick-possibly sills or dykes? To the east in the trench seeing bright green fuchsite material which appears to form matrix to fault breccia "draping" over the quartzite.			
75	301733	5781205	T2-1		65000	8000	90	Outcrop		60/40	
								Trench 3: cream to grey quartzite overlying maroon coloured hematitic sediment (?) (Uranerz andesite intrusive). Riddled with specular hematite filled fractures.	235/20		
76	301746	5781221			4500	175	30	Outcrop			
80	301083	5780828		60			Outcrop	Line 8W/0+75S-massive green medium grained gabbro.			
81	301145	5780847		60			Outcrop	gabbro. Very weak topo linear at 040-possible structure?			
82	301155	5780810		135			Boulder	slab of pink medium to coarse grained quartzite under moss cover.			
83	301132	5780810		80			Outcrop	pink quartzite.			
84	301070	5780783		100			Outcrop	quartzite.			
85	300987	5780784		60			Outcrop	massive gabbro.			
86	300937	5780747		60			Outcrop	massive gabbro ridge			
87	300902	5780725		50			Outcrop	Prominent ridge of the gabbro coincident with mag trend.			
88	300913	5780713		130			Outcrop	Quartzite just southeast of gabbro knob at wpt. 87. Seeing the same thin (10 cm thick) fine grained purplish conformable sill like intrusives.			
89	300892	5780705		140			Outcrop	massive gabbro; 2-3 cm thick quartz hematite joint fill that runs 140 cps.		0030/vert	
90	300801	5780685		70			Outcrop	medium grained massive gabbro.			
91	300846	5780652		50			Outcrop	massive gabbro.			
92	300594	5780728		60				Northwest of the baseline on Line 13 West. The mag high is supposed to			
								Down in swampy flat area northwest of gabbro ridge; seeing angular boulders and slabs of quartz pebble conglomerate, sometimes with jasperoidal clasts; high background at 140 cps.			
93	300848	5780811		140			Boulder				
94	301595	5781141		75			Outcrop	Back to BL 2 West and prospecting the E-W mag break; massive gabbro.			
95	301587	5781085		80			Outcrop	pink fine grained arkosic quartzite.			
96	301599	5781094		60			Outcrop	N-S trending ridge of fine to medium grained gabbro; Cut by <= 1 cm thick hematite stained calcite veinlets.			
97	301562	5781082		150-200			Outcrop	high background radioactivity.			
98	301571	5781082		1800			Outcrop	The pinkish quartzite exposed in 1.5 meter high moss covered east facing ridge. At the base of this getting scintillometer response of 1,800 cps. Gabbro is less than 10 meters to WNW. Also seeing the same 2-5 cm thick maroon coloured conformable layers as per Trenches 1 and 2.			
J. Robert Boulder Train											
77	298602	5779741					Boulder	Line 38 W/1+50N in a dried up boulder choked river bed with 1000's of subrounded quartz boulders.			
								Three radioactive boulders within 10 to 15 meters of each other. Subrounded to subangular fine grained gabbro with 1 to 3mm ferromag bands that may be source of U.			
78	298724	5779798		>100,000			Boulder	0.6m by 0.4m subrounded gabbro boulder as per 78.			
79	298699	5779781		>100,000	6000	200	Boulder	Sub-rounded gabbro boulders still embedded in pit dug by Uranerz. Second boulder 3 meters away at 2800 cps			
105	298682	5779724		7300			Boulder	Subrounded mafic boulder; 40 by 30 by 30 cm; appears to be amphibolite; still seeing the narrow ferromag joint fills.			
106	298689	5779722		8800	>100,000		Boulder	Radioactive fine grained amphibolitized mafic rock with yellow altered plagioclase(?) phenocrysts			
107	298684	5779714	206551	8800			Boulder				

B. Willett (Marc-André / J. Robert) Field notes

108	298657	5779702	206552	8000			Boulder	Hematized angular to sub-angular block/slab measuring 50 by 40 by 10 cm. This could be a fairly local slab. Characterized by moderate to relatively pervasive hematization. Protolith is a medium grained amphibolite. Approx 20 meter to the south and just up from lake shore is a cluster of 3 sub-rounded to sub-angular radioactive boulders of same lithology.			
109	298840	5779680	206553	>10,000			Boulder	As per 108 to 108.			
110	298634	5779678		>10,000			Boulder	Cluster of radioactive boulders as per 106 to 109.			
111	298625	5779667		>10,000			Boulder	Cluster of angular to sub-angular, radioactive gabbroic boulders. In appearance they seem to be fairly locally derived.			
112	298611	5779647		4000			Boulder	Thin sub-angular slab of the amphibolite. Similar boulder noted within 10 meters distance.			

LAPARRE CLAIM BLOCK

Following the completion of the diamond drilling program over the Marc-André claim block, the prospecting crews were then asked to make systematic traverses over all the outcropping areas within the LaParre claim block. Since no aerial mag-spectro survey had been completed up until mid-August, it appeared to us as the best way to maximize the production of the prospecting crews.

Two more prospecting crews have participated to the prospecting activities over the LaParre claim block. One crew was composed of David Frappier-Rivard geologist, with two prospectors, Mr. Jean-Louis Dusseault and Philippe Goujard. Later on two other prospectors were hired to replace Mr. Rivard and Goujard. These two prospectors were Mr. Raynald Poirier and Alex Poirier.

Following the reception of the Mag-spectro aerial survey results, eighteen targets were selected for ground follow-up. Among those eighteen targets, five were found to be caused by large (several hundred meters) radioactive areas associated to local outcropping sedimentary units. Two other targets were found to be caused by sub-rounded block fields (target 12 and 14) within large washed out areas following old riverbeds and, containing a high proportion of anomalous sub-rounded blocks. The remaining eleven targets were not clearly explained, the later being covered by extensive fluvio-glacial deposit.

Prior to the Mag-Spectro aerial survey, an important amount of radioactive conglomeratic arenite boulders had been located over the Laparre claim block but, very few outcrops had been sampled. The result of the aerial survey has led to the localization of a large sub-outcropping area, in the north-eastern and western parts of the claim block. These later areas are occupied by arenitic to conglomeratic quartzite with rounded qtz-pebbles interbeds (Targets 2, 3 and 5). Those later conglomeratic quartzite interbeds are often weakly hematized and are anomalously radioactive. The stratigraphy is generally sub-horizontal to shallowly dipping and gives a relatively strong radiometric background in that same part of the claim block.

Two other targets, 17 and 16, were found to be caused by local radioactive lithologies, while a weakly anomalous quartzitic outcrop was located around target 15.

A total of 166 samples were collected over the Laparre claim block, 50 outcrops and 116 blocks.

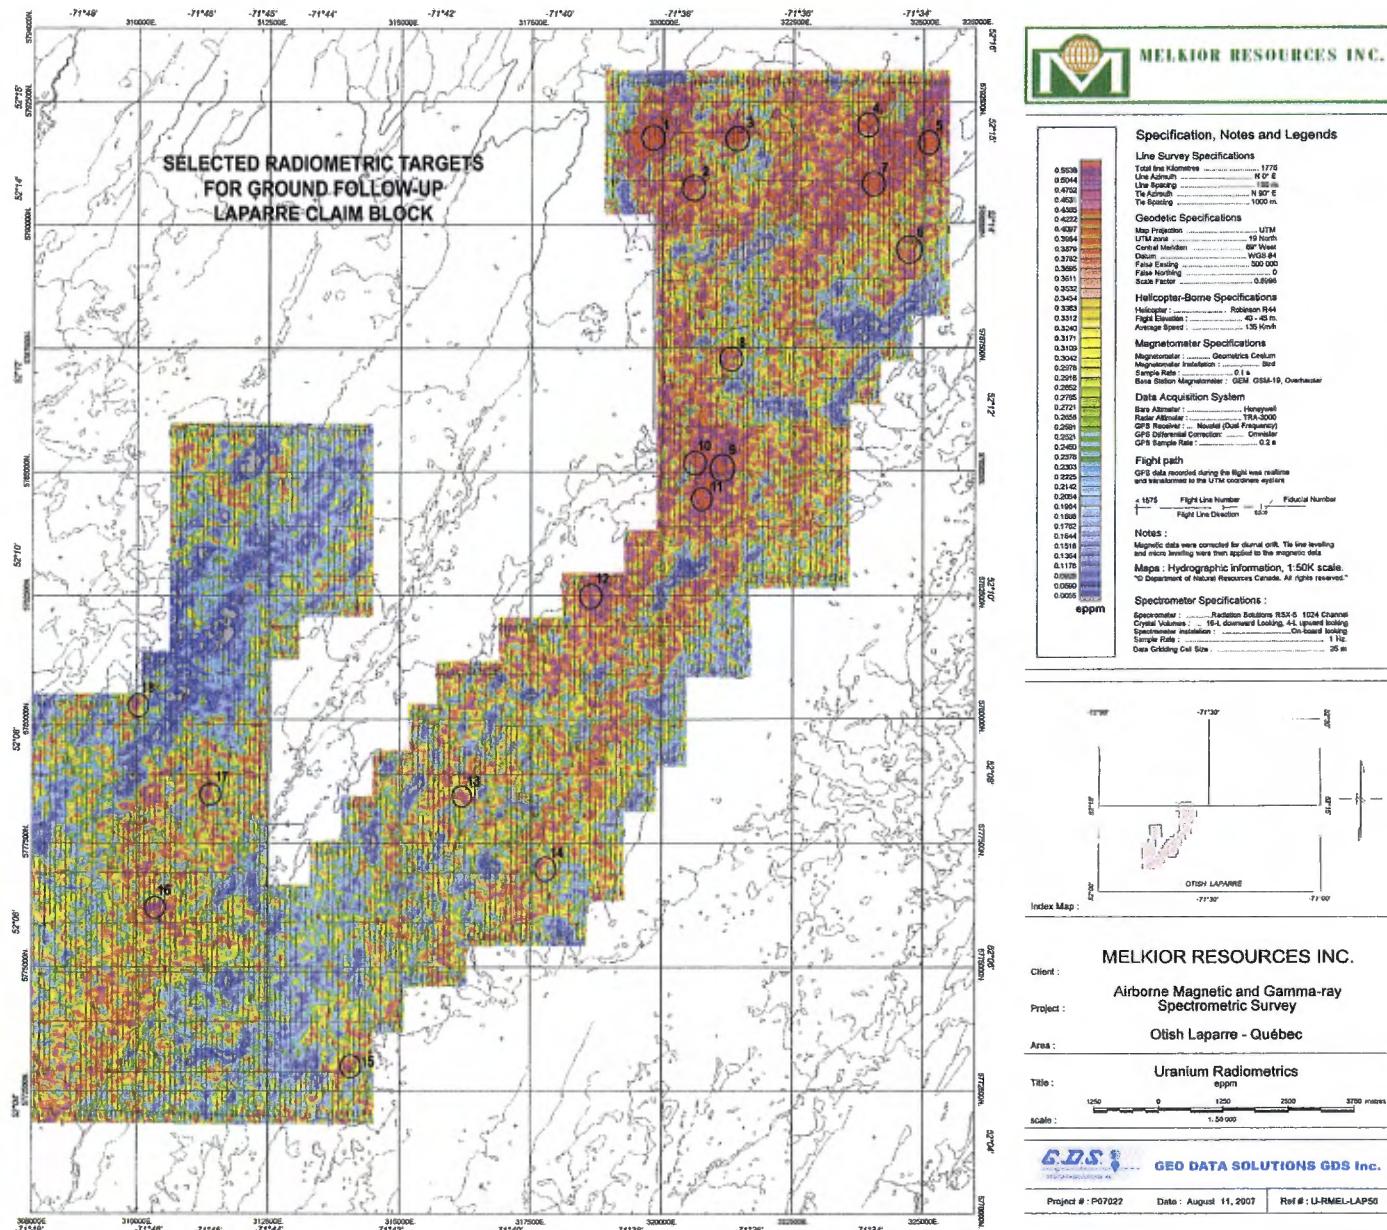

Fig. 7- Selected radiometric targets Laparre claim block

GROUND FOLLOW-UP LAPARRE RADIOMETRIC TARGET

- Target # 1- This area is occupied by a thick blanket of fluvio-glacial deposit cut by local steep gully. The source of the radiometric anomaly is not explained.
- Target # 2- Radioactive outcrops composed of conglomeratic arenites and qtz-pebbles conglomerate with an arenitic matrix. Highest total counts values vary between 2000 and 3000 CPS
- Target # 3- Radioactive outcrops composed of conglomeratic arenites and qtz-pebbles conglomerate with an arenitic matrix. Highest total counts values vary between 1000 and 1500 CPS. Anomalous readings associated with thin qtz-pebbles conglomerate interbeds with a shallow dipping (128/20).
- Target # 4- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is not explained.
- Target # 5- Radioactive outcrops composed of quartzite and conglomeratic quartzite. Highest total counts values vary between 900 and 1200 CPS.
- Target # 6- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is not explained.
- Target # 7- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is not explained.
- Target # 8- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is not explained.
- Target # 9- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is not explained.
- Target # 10- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is not explained.
- Target # 11- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is not explained.

Target # 12- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is probably caused by the presence of a large boulder field (sub-rounded boulders) following an ancient river bed. Highest total counts vary between 130 and 200 cps with occasional peak at 300 cps.

Target # 13- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is not explained. Large dispersed block field.

Target # 14- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is not explained.

Target # 15- Area occupied by a thick blanket of fluvioglacial deposit. A small outcrop consisting of fine grained beige to pinkish quartzite was located on the shore of a small creek with total counts varying between 90 to 150 cps.

Target # 16- Area occupied by sub-outcropping fine to medium grained arenitic quartzite and local cherty argilite layer (?) or silicified argilite. Highest total counts 100 to 700 cps. (Samples 206943, 206578, 206579 and 206628)

Target # 17- Area occupied by numerous outcrops of fine grained arenitic quartzite. High background of 70 to 200 cps. Local hematized layers were observed. (Samples 206576, 206577 and 206626). Highest total counts 450 cps.

Target # 18- Area occupied by a thick blanket of fluvioglacial deposit. The source of the radiometric anomaly is probably caused by the presence of a large boulder field (sub-rounded quartzite boulders) with local scintillometer readings varying between 100 and 140 cps.

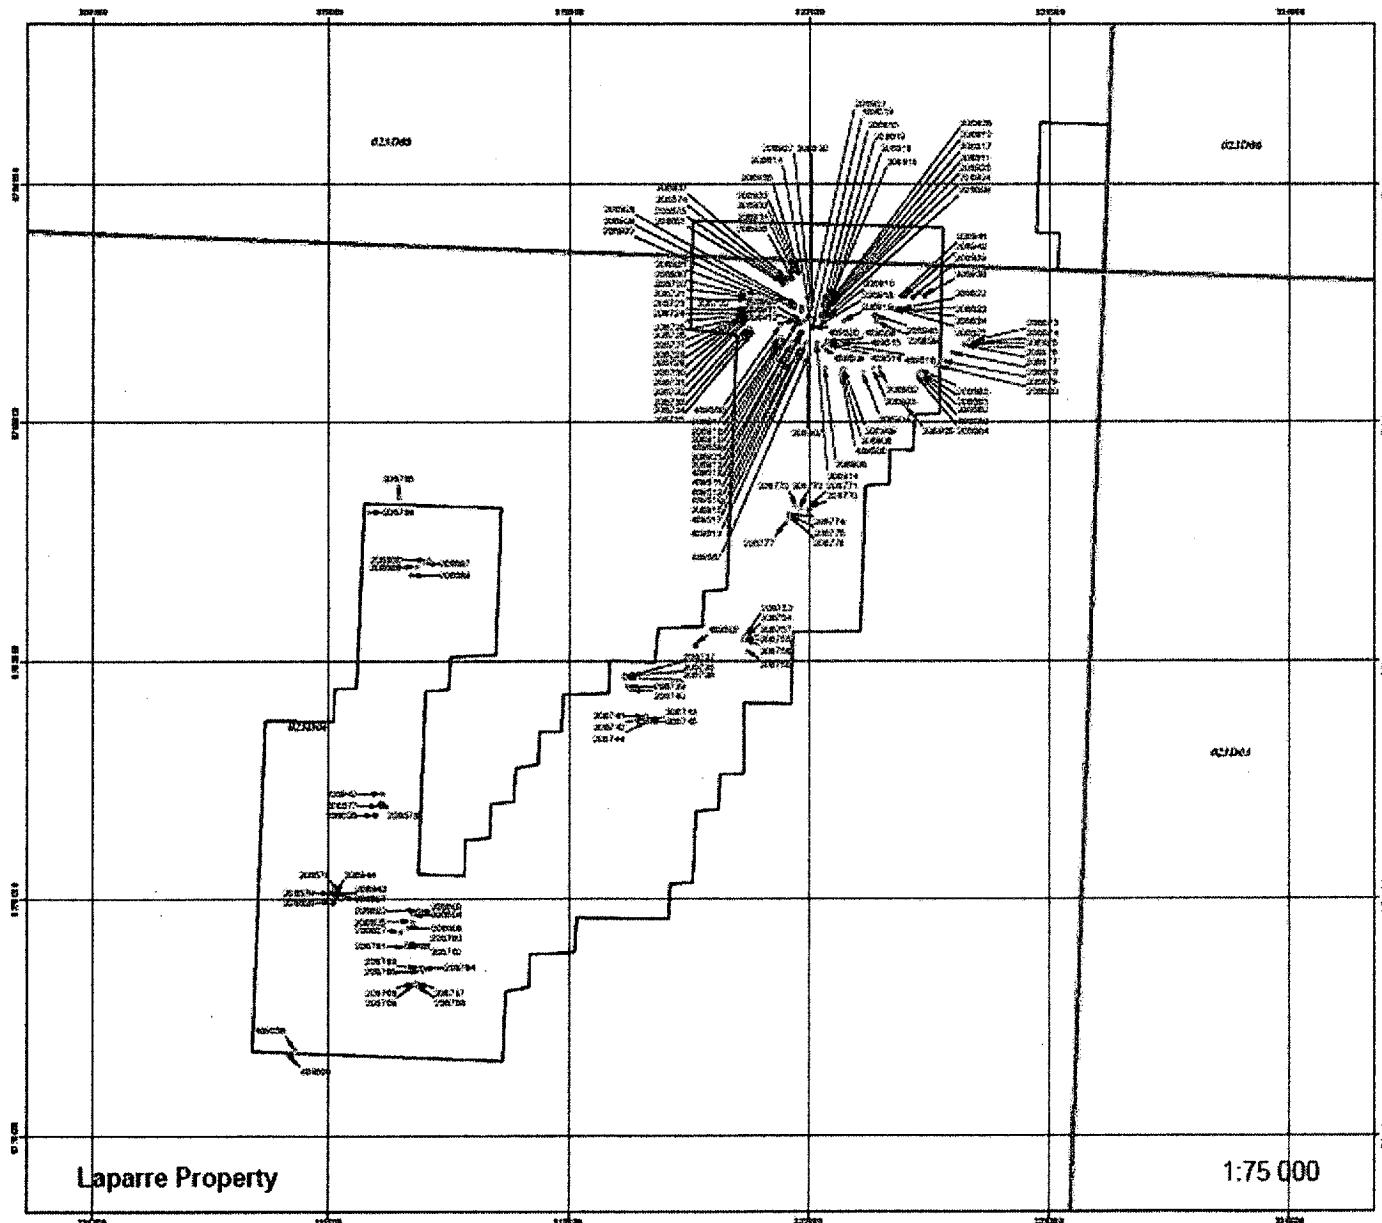

Fig. 8- SAMPLES LOCATION LAPARRE CLAIM BLOCK

BEAVER LAKE CLAIM BLOCK

The Beaver Lake Claim Block has been the site of prospecting over outcropping areas since no aerial survey was flown over that claim block before the end of the prospecting activities.

Topographic maps at 1:50000 scale were used to select areas of positive topographic relief and, scout rounds with the helicopter permitted to locate sub outcropping areas where prospecting crews would be sent to make traverses.

This claim block was found to be occupied mainly by granitic gneisses and pegmatite dykes. Those later pegmatite dykes returned fairly good scintillometer response and were sampled at several sites.

A total of 45 samples were collected from that claim block (20 from outcrops and 25 from blocks or unidentified source) where outcrops are relatively scarce.

The best results obtained from those samples returned 0,10 % U, 0,018% U from blocks (206716, 206715), and 0,019%, 0,014%, 0,012% U (from channel samples 206571 to 206573).

OTISH WEST CLAIM BLOCK

The Otish West Claim Block is part of the land package that was not flown with an aerial Mag-Spectro survey before the end of the summer prospecting activities and, in consequence, this area was only covered by basic uranium ground prospecting (hand-held scintillometer).

Only one area, in the south-central part of the claim block, has been sampled, where the host rock is composed of pegmatite dykes hosted within a granodioritic unit.

Twelve samples were collected from this claim block, eleven outcrop samples and one boulder sample. Two of those samples have returned anomalous U values (0,02% from sample 206704) (0,07% from sample 206706).

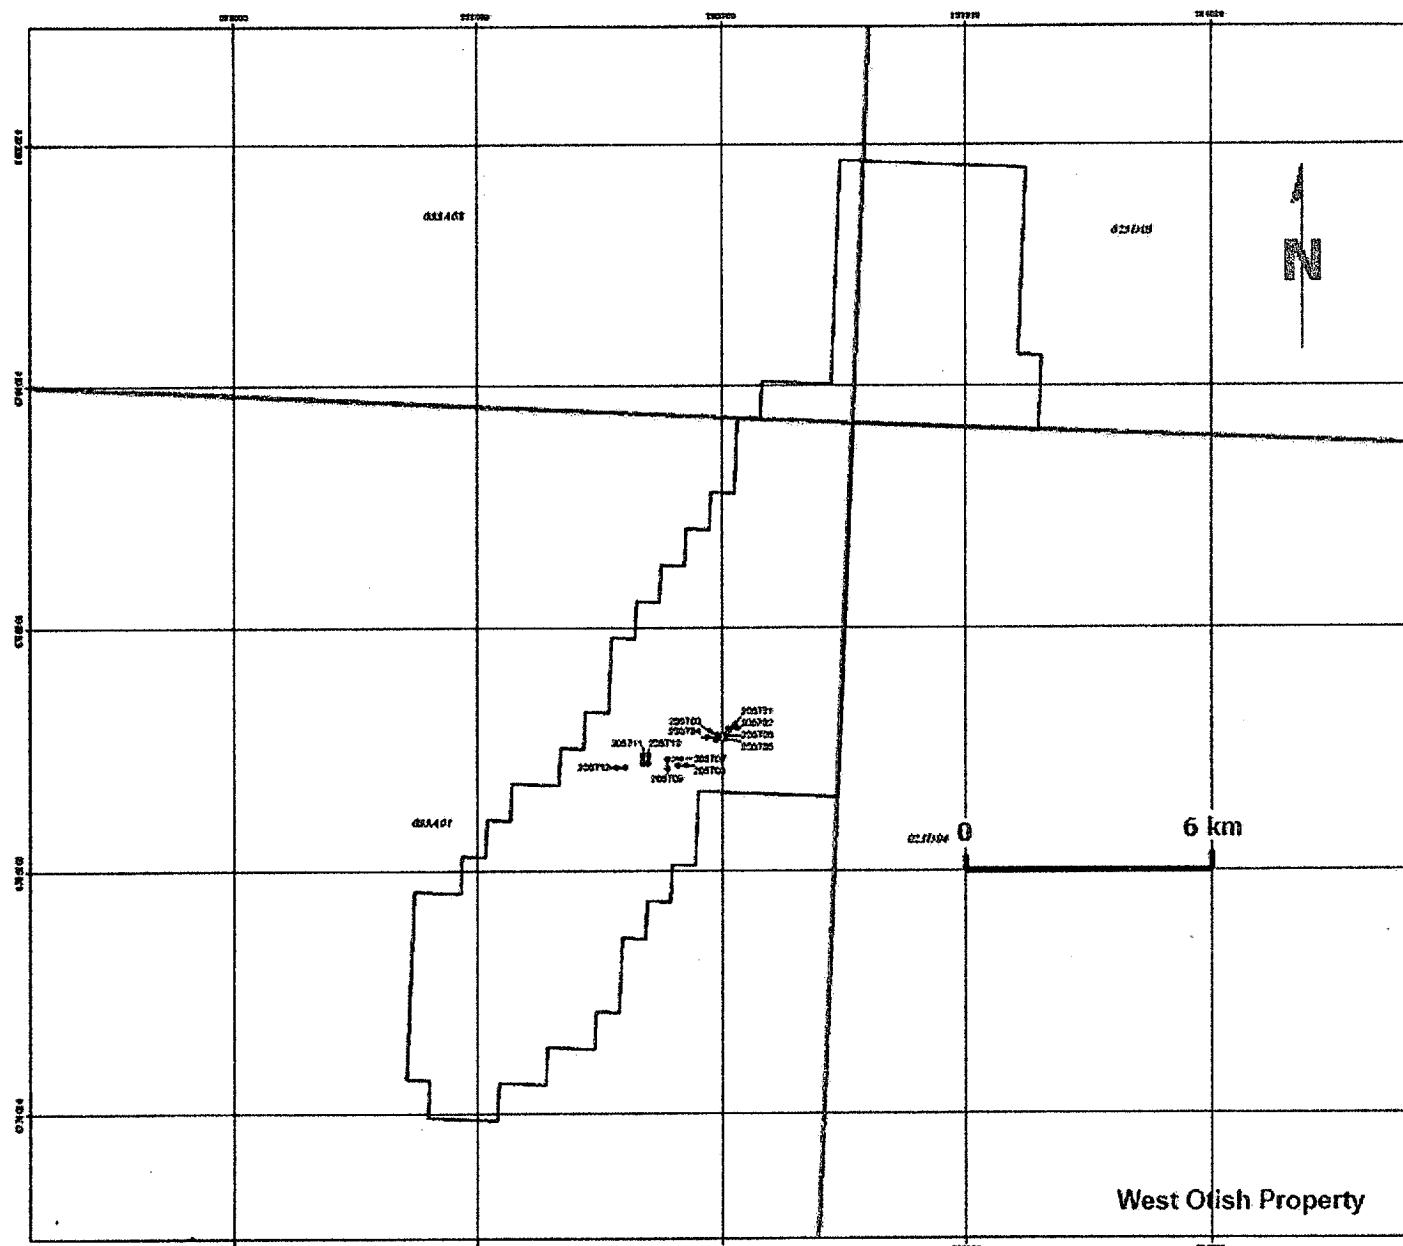

Fig. 10- SAMPLES LOCATION WEST OTISH CLAIM BLOCK

MELKIOR-SANTOY JOINT VENTURE
OTISH URANIUM PROJECT PROSPECTING SUMMER 2007

WEST OTISH BLOCK, SAMPLES DESCRIPTION

EAST OTISH CLAIM BLOCK

The East Otish Claim Block is another claim block where only hand-held scintillometer prospecting was performed over sub-outcropping areas that were selected from topographic maps and local scouting out by helicopter.

These prospecting task lead to the collecting of 42 samples (8 from outcrops and 34 from boulders). The boulders are mainly composed of granitic pegmatite, granodiorite and hematized micro-conglomerate. The outcrop samples have been collected from pegmatite, syenite and quartzite. One of the outcropping areas is located at the very limit of the northern boundary of the claim block. Pegmatite dykes believed to be hosted within a granodioritic unit occupy this later area. The second outcropping site is located some 10 km further south and is composed of a faulted quartzite.

Some of the conglomeratic boulders sampled in the southwestern portion of the claim block have a fairly high radioactivity level (13000 to 14000 cps). Sample 206796, collected from a hematized micro-conglomerate boulder, returned 0,018% U.

It is believed that with the completion of an aerial Mag-Spectro survey, several targets could be generated for ground prospecting follow-up over selected areas of that claim block.

OTISH URANIUM PROJECT PROSPECTING SUMMER 2007

EAST OTISH BLOCK, SAMPLES DESCRIPTION

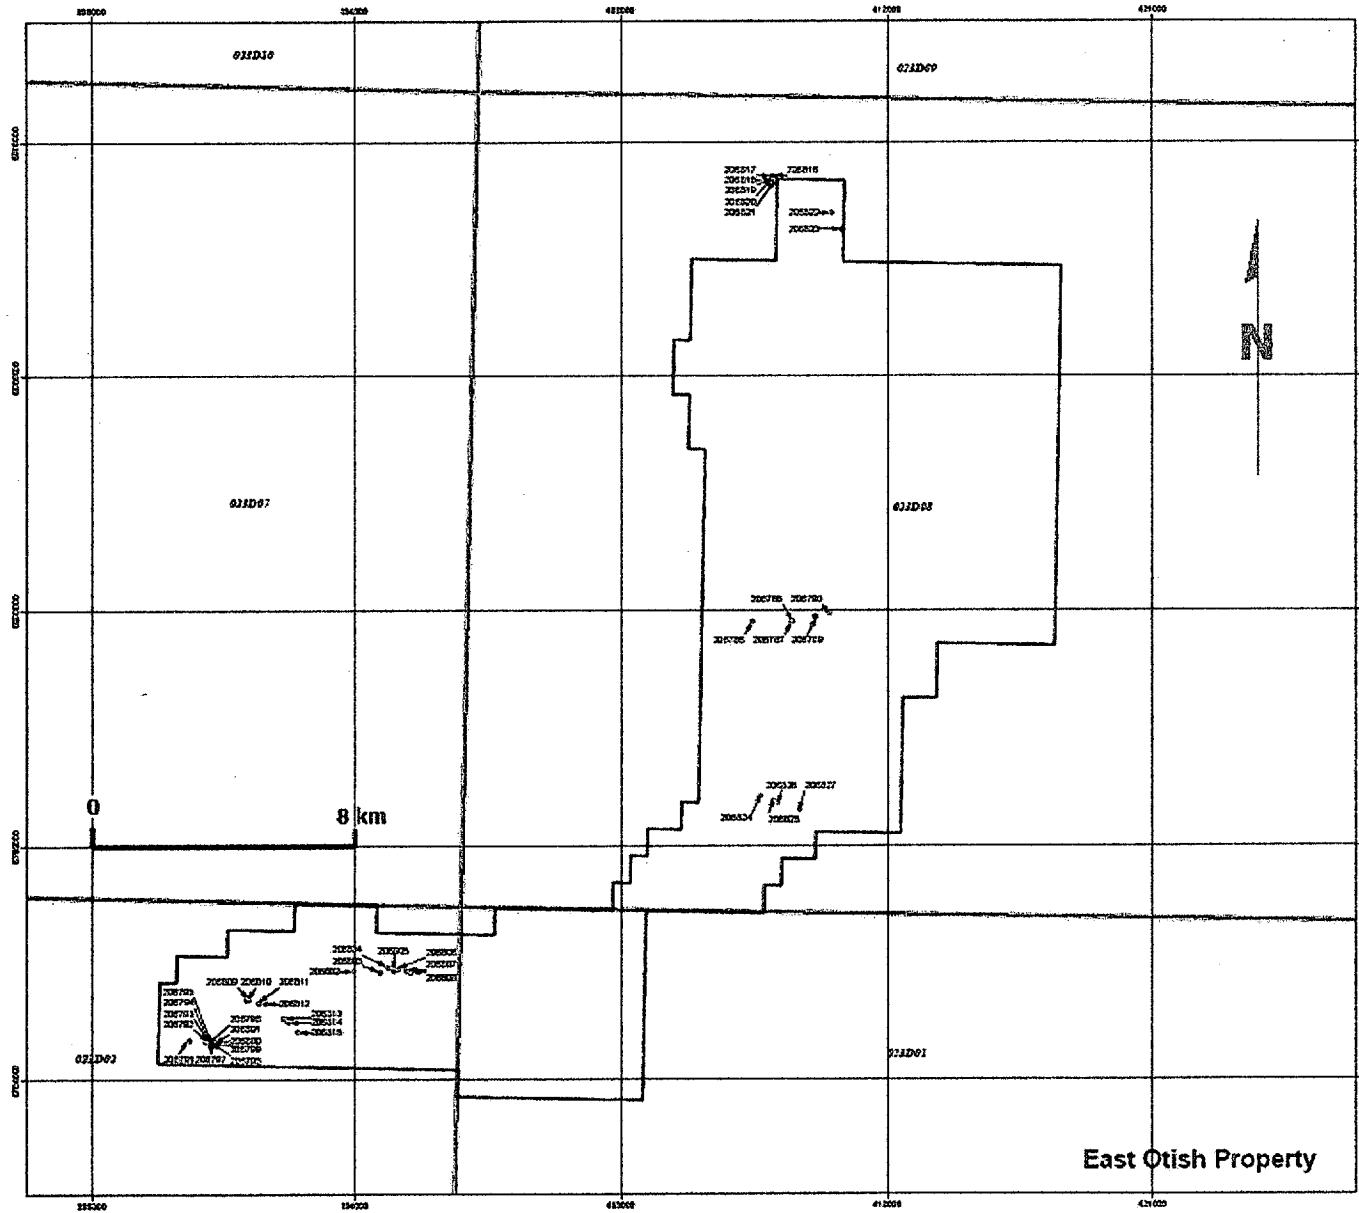

Fig. 11- EAST OTISH CLAIM BLOCK' SAMPLES LOCALISATION

CONCLUSION

This basic ground prospecting program over five different claim blocks within the Otish uranium Project area, has permitted to locate some radioactive lithologies in the Otish sedimentary Basin as well as in Archean basement lithologies.

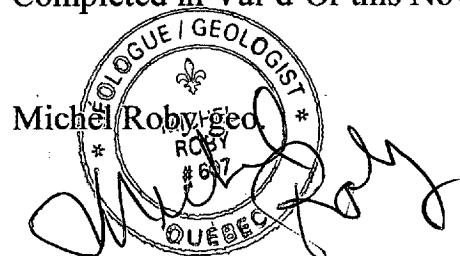

Two main types of radioactive lithologies have been observed and sampled along the prospecting program. The radioactive lithologies sampled within the Otish Sedimentary Basin (Marc-André, LaParre and East Otish blocks) are mainly associated to thin quartz-pebbles conglomeratic layers hosted in coarse-grained quartz-arenitic sequences. However, The Marc-André uranium occurrence is closely associated to a gabbroic intrusive dyke. This later geological setting is also observed at the Matoush uranium deposit where the proposed model favours the perched body setting.

Although no gabbroic outcrops have been recorded in the other claim blocks, the Mag-Spectro survey over the LaParre block shows several linear high-mag trends that are most likely caused by intrusive mafic dykes. Since several uranium occurrences in the Otish Basin are closely associated to these later mafic dykes and parallel fault zones, it would be advisable to concentrate the next phase of prospecting in the vicinity of these lithological features.

The second type of radioactive lithology is associated to pegmatite dykes hosted within gneissic granitic basement rocks of Archean age. This later type of radioactive lithology was observed within the Beaver Lake, Otish West and Otish East claim blocks. Although the uranium assay results were relatively low, between 0,012 to 0,019 % U, it is a clear evidence of the potential to host higher-grade zones within that later type of lithology. A future Mag-Spectro survey covering these claim blocks should generate a number of targets to be followed-up by ground prospecting.

Finally, all the assay results should be analyzed by a uranium oriented geochemist to find possible pathfinder elements that would indicate local alteration haloes and generate follow-up targets.

Completed in Val-d'Or this November 10th 2008

APPENDIX I

ASSAY RESULTS PARTIAL DIGESTION

ICP4.3R Partial Digestion

Column Header Details

Silver in ppm (Ag)
Arsenic in ppm (As)
Bismuth in ppm (Bi)
Cobalt in ppm (Co)
Copper in ppm (Cu)

Germanium in ppm (Ge)
Mercury in ppm (Hg)
Molybdenum in ppm (Mo)
Nickel in ppm (Ni)
Lead in ppm (Pb)

Antimony in ppm (Sb)
Selenium in ppm (Se)
Tellurium in ppm (Te)
Uranium in ppm (U, ICP)
Vanadium in ppm (V)

Zinc in ppm (Zn)

Date of Report: January 31, 2008

ICP1 Partial Digestion

Sample Number	Ag ppm	As ppm	Bi ppm	Co ppm	Cu ppm	Ge ppm	Hg ppm	Mo ppm	Ni ppm	Pb ppm	Sb ppm	Se ppm	Te ppm	U, Fl. ppm	V ppm	Zn ppm
---------------	--------	--------	--------	--------	--------	--------	--------	--------	--------	--------	--------	--------	--------	------------	-------	--------

Partial Digestion: A 1.00 g pulp is digested with 2.25 ml of 8:1 HNO₃:HCl for 1 hour at 95C.
The standard is LS4.

Total Digestion: A 0.125 g pulp is gently heated in a mixture of HF/HNO₃/HClO₄ until dry and the residue is dissolved in dilute HNO₃.
The standard is CG515.

ICP4.3 Total Digestion

Column Header Details

Silver in ppm (Ag)
Aluminum in wt % (Al₂O₃)
Barium in ppm (Ba)
Beryllium in ppm (Be)
Calcium in wt % (CaO)

Cadmium in ppm (Cd)
Cerium in ppm (Ce)
Cobalt in ppm (Co)
Chromium in ppm (Cr)
Copper in ppm (Cu)

Dysprinnoium in ppm (Dy)
Erbium in ppm (Er)
Europium in ppm (Eu)
Iron in wt % (Fe₂O₃)
Gallium in ppm (Ga)

Gadolinium in ppm (Gd)
Hafnium in ppm (Hf)
Holmium in ppm (Ho)
Potassium in wt % (K₂O)
Lanthanum in ppm (La)

Lithium in ppm (Li)
Magnesium in wt % (MgO)
Manganese in wt % (MnO)
Molybdenum in ppm (Mo)
Sodium in wt % (Na₂O)

Niobium in ppm (Nb)
Neodymium in ppm (Nd)
Nickel in ppm (Ni)
Phosphorus in wt % (P₂O₅)
Lead in ppm (Pb)

Praseodymium in ppm (Pr)
Scandium in ppm (Sc)
Samarium in ppm (Sm)
Tin in ppm (Sn)
Strontium in ppm (Sr)

Tantalum in ppm (Ta)
Terbium in ppm (Tb)
Thorium in ppm (Th)
Titanium in wt % (TiO₂)
Uranium in ppm (U, ICP)

Total Digestion: A 0.125 g pulp is gently heated in a mixture of HF/HNO₃/HClO₄ until dry and the residue is dissolved in dilute HNO₃.
The standard is CG515.

ICP4.3 Total Digestion

Column Header Details

Silver in ppm (Ag)
Aluminum in wt % (Al₂O₃)
Barium in ppm (Ba)
Beryllium in ppm (Be)
Calcium in wt % (CaO)

Cadmium in ppm (Cd)
Cerium in ppm (Ce)
Cobalt in ppm (Co)
Chromium in ppm (Cr)
Copper in ppm (Cu)

Dysprnnoisium in ppm (Dy)
Erbium in ppm (Er)
Europium in ppm (Eu)
Iron in wt % (Fe₂O₃)
Gallium in ppm (Ga)

Gadolinium in ppm (Gd)
Hafnium in ppm (Hf)
Holmium in ppm (Ho)
Potassium in wt % (K₂O)
Lanthanum in ppm (La)

Lithium in ppm (Li)
Magnesium in wt % (MgO)
Manganese in wt % (MnO)
Molybdenum in ppm (Mo)
Sodium in wt % (Na₂O)

Niobium in ppm (Nb)
Neodymium in ppm (Nd)
Nickel in ppm (Ni)
Phosphorus in wt % (P₂O₅)
Lead in ppm (Pb)

Praseodymium in ppm (Pr)
Scandium in ppm (Sc)
Samarium in ppm (Sm)
Tin in ppm (Sn)
Strontium in ppm (Sr)

Tantalum in ppm (Ta)
Terbium in ppm (Tb)
Thorium in ppm (Th)
Titanium in wt % (TiO₂)
Uranium in ppm (U, ICP)

ICP4.3 Total Digestion

Column Header Details

Vanadium in ppm (V)
Tungsten in ppm (W)
Yttrium in ppm (Y)
Ytterbium in ppm (Yb)
Zinc in ppm (Zn)

Zirconium in ppm (Zr)

Total Digestion: A 0.125 g pulp is gently heated in a mixture of HF/HNO₃/HClO₄ until dry and the residue is dissolved in dilute HNO₃.
The standard is CG515.

ICP4.3 Total Digestion

Column Header Details

Silver in ppm (Ag)
Aluminum in wt % (Al₂O₃)
Barium in ppm (Ba)
Beryllium in ppm (Be)
Calcium in wt % (CaO)

Cadmium in ppm (Cd)
Cerium in ppm (Ce)
Cobalt in ppm (Co)
Chromium in ppm (Cr)
Copper in ppm (Cu)

Dysprinonium in ppm (Dy)
Erbium in ppm (Er)
Europium in ppm (Eu)
Iron in wt % (Fe₂O₃)
Gallium in ppm (Ga)

Gadolinium in ppm (Gd)
Hafnium in ppm (Hf)
Holmium in ppm (Ho)
Potassium in wt % (K₂O)
Lanthanum in ppm (La)

Lithium in ppm (Li)
Magnesium in wt % (MgO)
Manganese in wt % (MnO)
Molybdenum in ppm (Mo)
Sodium in wt % (Na₂O)

Niobium in ppm (Nb)
Neodymium in ppm (Nd)
Nickel in ppm (Ni)
Phosphorus in wt % (P₂O₅)
Lead in ppm (Pb)

Praseodymium in ppm (Pr)
Scandium in ppm (Sc)
Samarium in ppm (Sm)
Tin in ppm (Sn)
Strontium in ppm (Sr)

Tantalum in ppm (Ta)
Terbium in ppm (Tb)
Thorium in ppm (Th)
Titanium in wt % (TiO₂)
Uranium in ppm (U, ICP)

Total Digestion: A 0.125 g pulp is gently heated in a mixture of HF/HNO₃/HClO₄ until dry and the residue is dissolved in dilute HNO₃.

The standard is CG515.

ICP1 Total Digestion

Sample Number	Sr ppm	Ta ppm	Tb ppm	Th ppm	TiO ₂ wt %	U, ICP ppm	V ppm	W ppm	Y ppm	Yb ppm	Zn ppm	Zr ppm
---------------	--------	--------	--------	--------	-----------------------	------------	-------	-------	-------	--------	--------	--------

Total Digestion: A 0.125 g pulp is gently heated in a mixture of HF/HNO₃/HClO₄ until dry and the residue is dissolved in dilute HNO₃.
The standard is CG515.
