SOMMAIRE

La propriété Whabouchi est située dans le nord-ouest de la province de Québec. Elle se trouve à environ 300 km au nord-ouest de la ville de Chibougamau et est accessible par la Route du Nord. La propriété consiste d'un bloc de 33 claims situé dans le feuillet SRNC 32O12 et appartient à 100% à Nemaska Exploration Inc.

La propriété est un projet d'exploration minière pour le lithium dans des dykes de pegmatite à spodumène (pyroxène de lithium $\text{LiAlSi}_2\text{O}_6$).

Ce rapport couvre 3 campagnes de tranchées et 3 campagnes de forages effectuées entre le 10 octobre 2009 et le 27 mai 2011. Durant cette période Nemaska Exploration Inc a effectué 4200 m de tranchées desquelles 945 m de rainures ont été prélevées et 124 forages ont été faits totalisant 24629 m. Au total 13191 analyses ont été effectuées sur les échantillons de rainures et de forages.

L'objectif des travaux de tranchées et de forages était de définir une ressource suffisante pour pouvoir démarrer une mine de lithium.

Les dykes de pegmatite à spodumène se retrouvent dans une bande de méta-basalte d'environ 0.5 km de large par 3.6 km de long orienté nord-est à 060 degré. Le méta-basalte est métamorphisé au faciès amphibolite. La bande de méta-basalte se trouve au centre de la propriété Whabouchi entre le Lac du Spodumène et le Lac des Montagnes. Les dykes de pegmatite à spodumène sont eux aussi orientés nord-est à 060 degré avec un pendage vers le sud-est de 70 à 80 degré. Les dykes de pegmatite se trouvent au centre de la bande de méta-basalte et s'étendent sur une largeur de 100 m par une longueur de 1400 m. Le groupe de dykes de pegmatite à spodumène est formé par un dyke principal de 40 à 80 m d'épaisseur situé du côté nord-ouest et de deux groupes de dykes secondaires d'environ 10 m d'épaisseur situés au sud-ouest et nord-est.

L'ensemble des travaux de tranchées et de forages effectués par Nemaska Exploration ont permis d'établir un modèle en trois dimensions des dykes de pegmatite minéralisés en spodumène et d'effectuer un calcul de ressources.

Le calcul de ressources a été effectué par la division Geostat de SGS Canada Inc, (Laferrière, 2011)¹. Les ressources établies sont de 25.1 million de tonnes mesurées et indiquées à 1.54% Li₂O, 140 ppm BeO et 4.4 million de tonnes présumées à 1.51% Li₂O, 136 ppm BeO.

Ces ressources classent le gisement de Whabouchi comme le deuxième au monde en tonnage et teneur pour les gisements de lithium dans la roche, l'autre type de gisement étant les saumures de lacs salés. Ce classement indique que le gisement Whabouchi a le tonnage et la teneur pour être exploité économiquement.

¹LAFERRIÈRE, A. (2011). NI 43-101 Technical Report, Updated Mineral Resource, Whabouchi Lithium Deposit, prepared by SGS Canada Inc. (Geostat) for Nemaska Exploration Inc.

1. INTRODUCTION

A) OBJECTIF

L'objectif des travaux de tranchées et de forages d'octobre 2009 à mai 2011 était d'établir une ressource suffisante pour pouvoir démarrer une mine de lithium.

B) SOURCES DES RENSEIGNEMENTS ET DES DONNÉES

Le contenu du présent rapport provient des travaux de tranchées et forages effectués par Nemaska Exploration inc d'octobre 2009 à mai 2011.

2. DESCRIPTION DE LA PROPRIÉTÉ

A) SUPERFICIE

La propriété Whabouchi est constituée d'un seul bloc totalisant 33 claims d'une superficie totale de 1761.9 hectares (Figure 3).

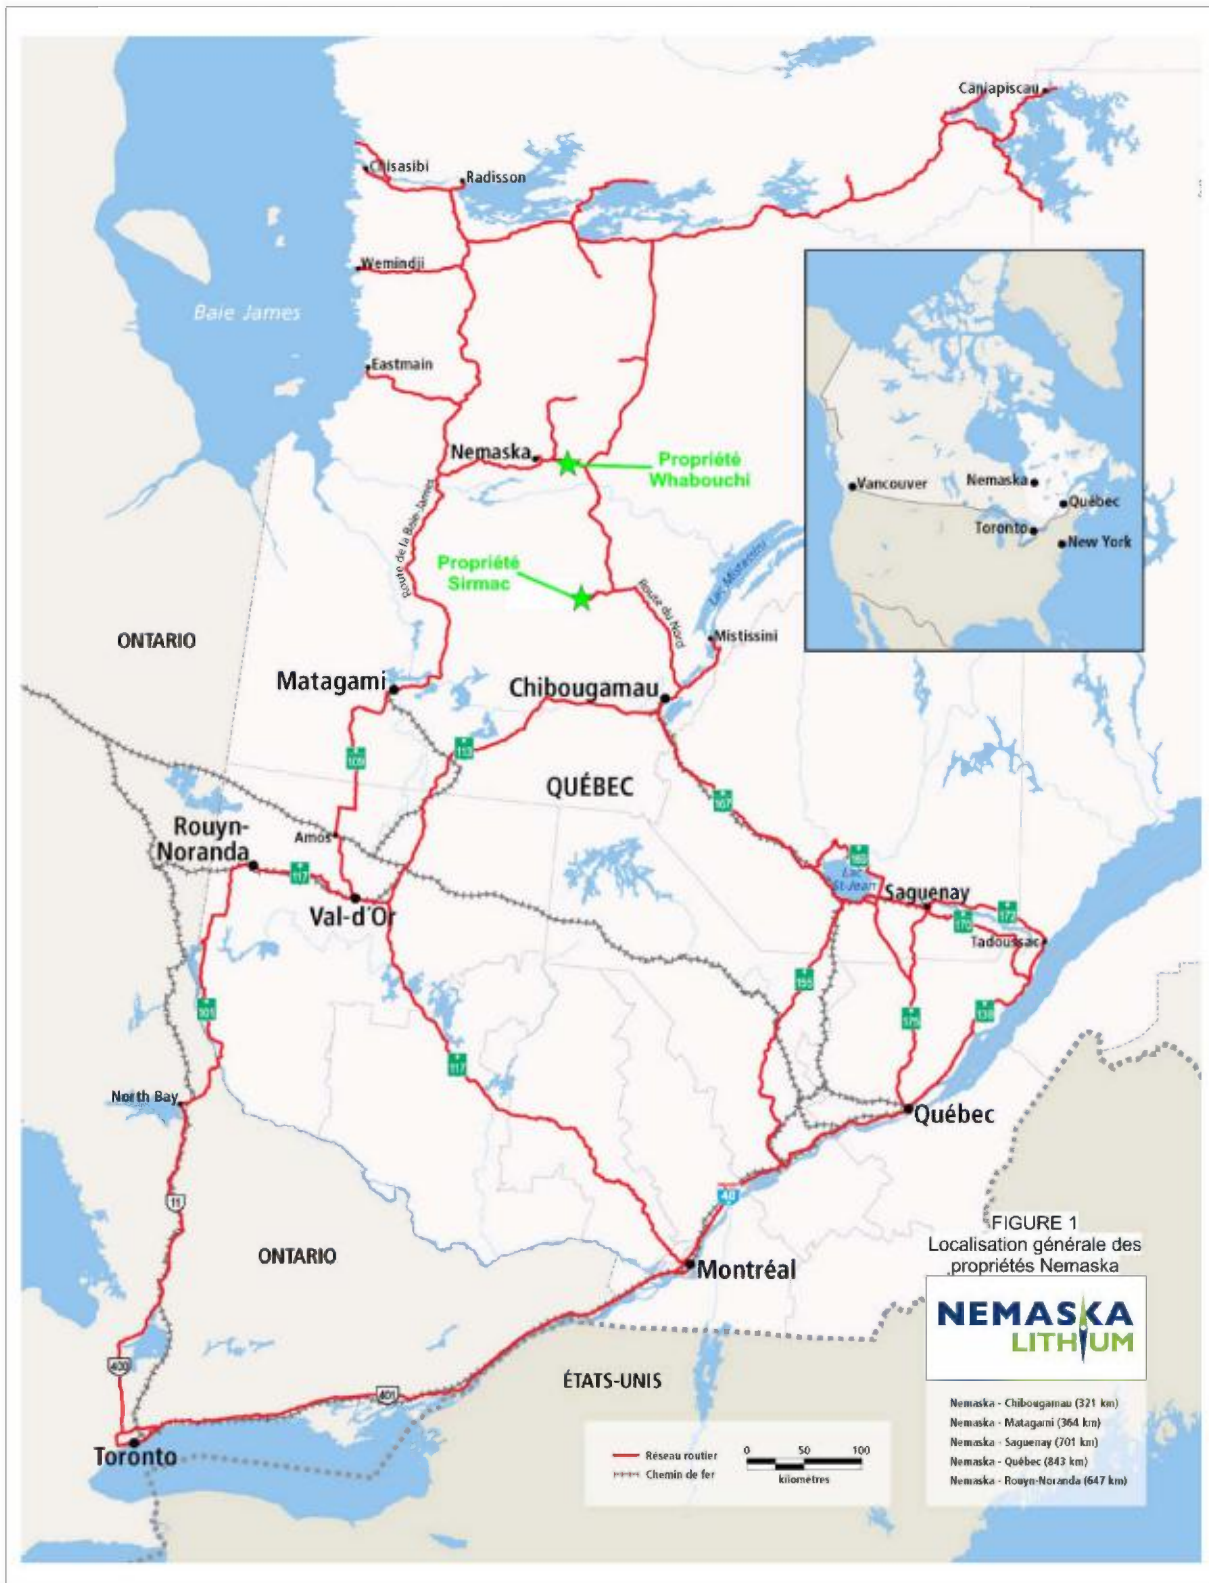

B) EMPLACEMENT

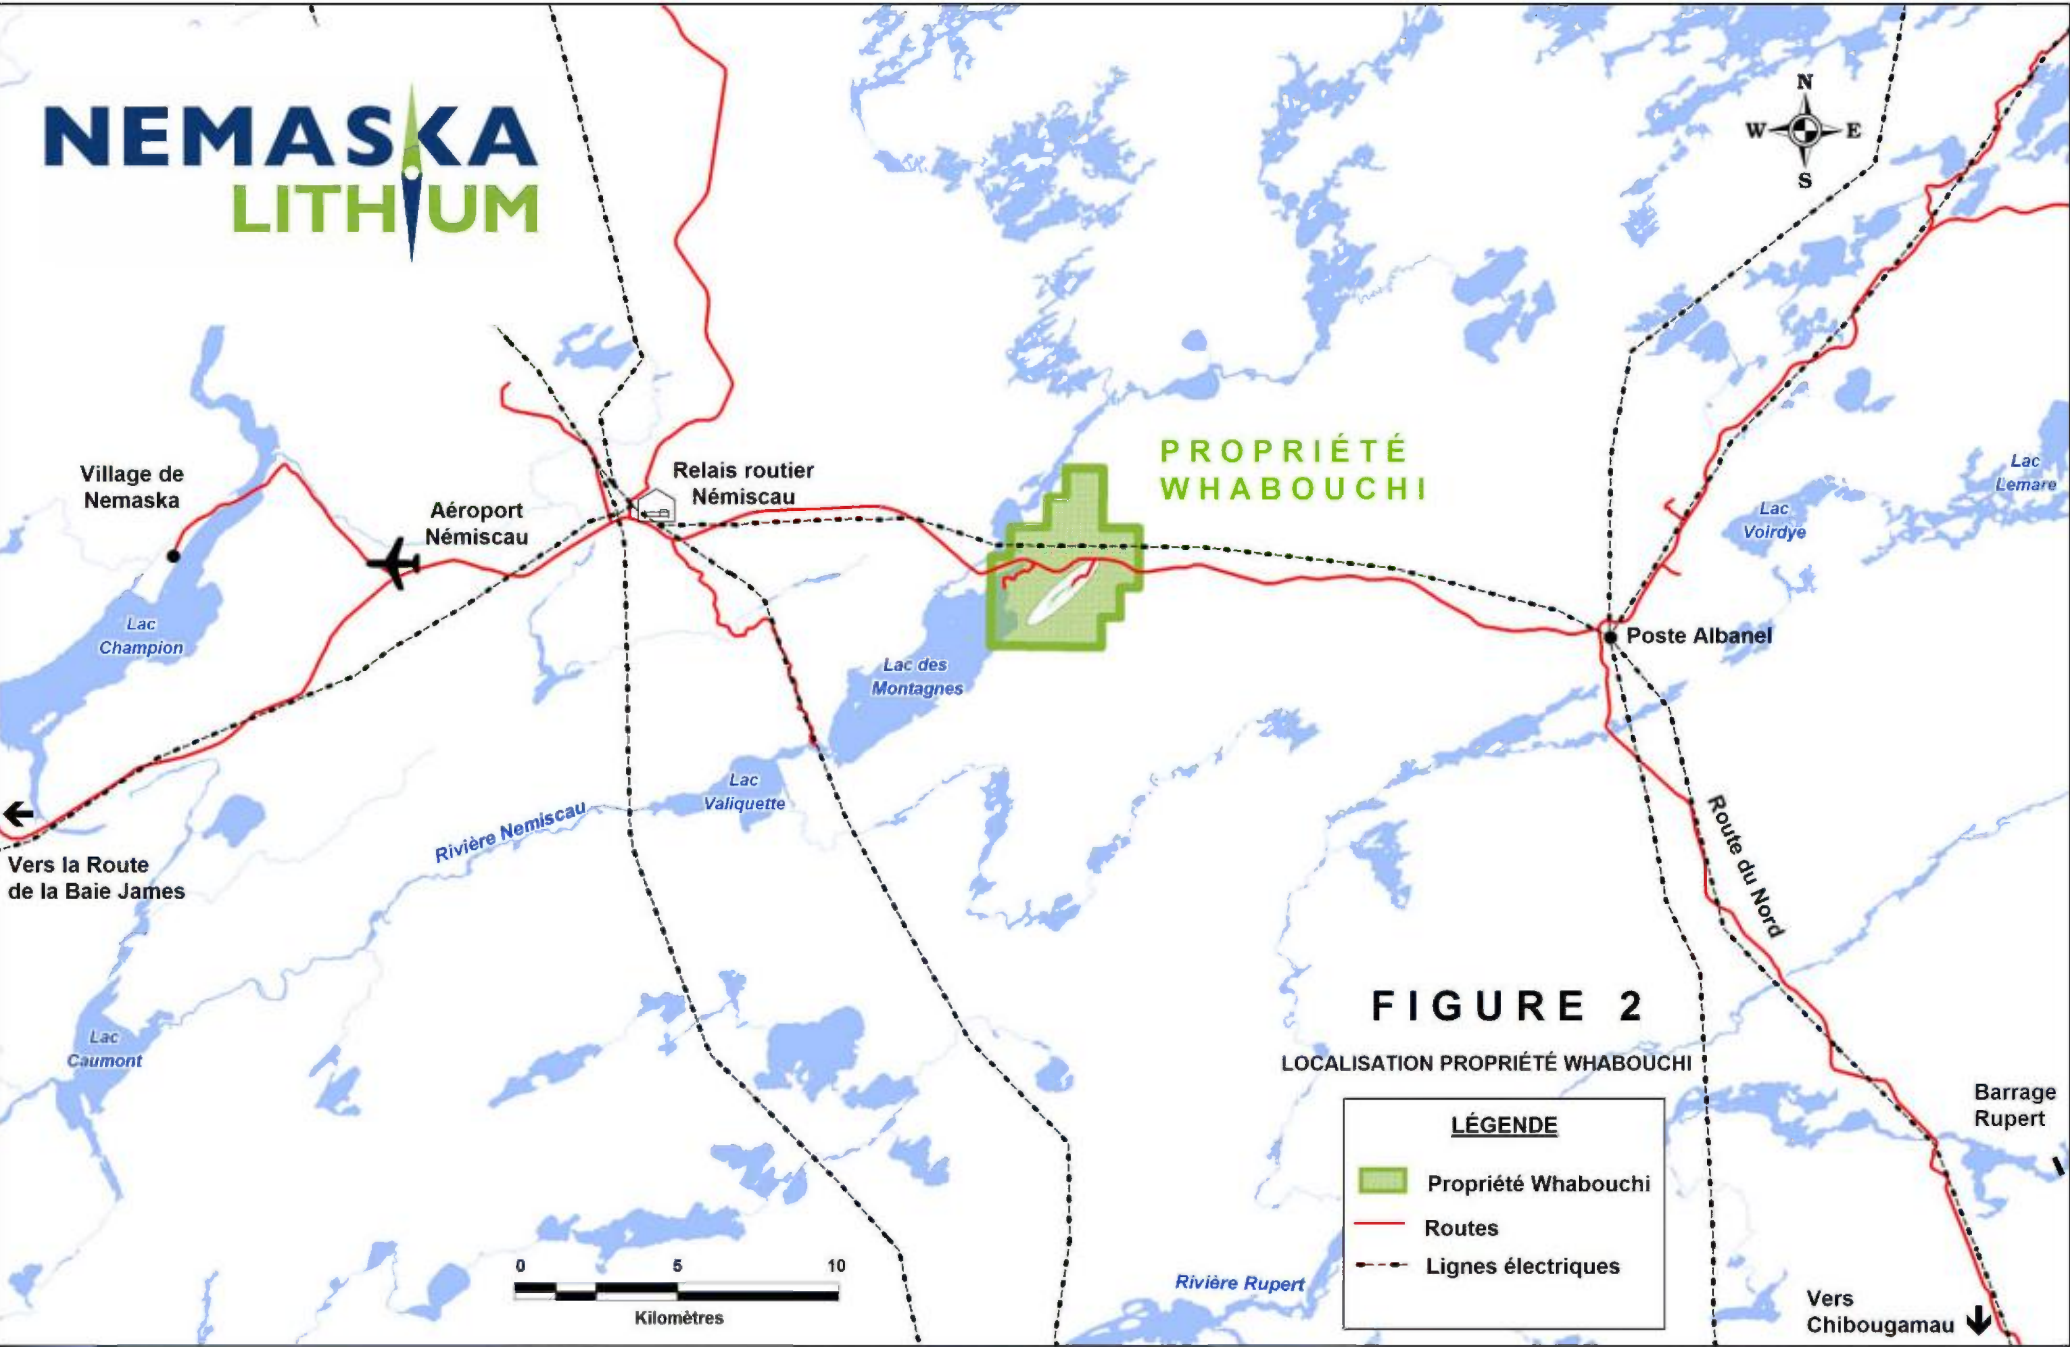

La propriété Whabouchi se situe dans le nord-ouest de la province de Québec. Elle se trouve à environ 300 kilomètres, par la route, au nord-ouest de la ville de Chibougamau (Figure 1). L'aéroport de Nemiscau se situe à 23 kilomètres à l'ouest de la propriété (Figure 2). Les coordonnées UTM du point central de la propriété sont 441 000mE – 5 726 000mN (UTM NAD83, Zone 18).

C) TYPE DE TITRE

La propriété Whabouchi contient 33 claims désignés sur carte (Figure 3) situés sur le feuillet SNRC 32O12. La liste complète des claims est énumérée dans l'Annexe 1 (En date du 29 novembre 2011).

D) DÉTENTEUR

Tous les claims sont détenus à 100% par Nemaska Exploration inc. Ces claims sont enregistrés en bonne et due forme auprès du gouvernement du Québec (Ministère des Ressources Naturelles et de la Faune du Québec). Les travaux requis au prochain renouvellement et les dates d'expiration sont indiqués dans le tableau de l'Annexe 1.

3. TOPOGRAPHIE, CLIMAT, ACCESSIBILITÉ ET INFRASTRUCTURE

A) TOPOGRAPHIE ET VÉGÉTATION

La topographie consiste en des terrains relativement plats d'une altitude moyenne de 300 mètres où les plus hauts points topographiques, environ à 325 mètres, sont causés par des roches plus compétentes, telles que les intrusions granitiques et les pegmatites. Environ 15% de la propriété est recouvert par des lacs et des rivières. La végétation est principalement constituée de mousses, de lichens et de conifères. Cette végétation, de type taïga, est clairsemée et a été partiellement détruite par des feux de forêt de 2002. Les dépôts glaciaires de la région consistent en tills indifférenciés composés de blocs et de sable. Des sols organiques plus ou moins décomposés recouvrent les parties plus basses et moins bien drainées. Ces dépôts ont une épaisseur variant de 0 à 25 mètres.

B) ACCESSIBILITÉ

La propriété Whabouchi est traversée par la Route du Nord (Figure 2). Cette route de gravier entretenue à l'année débute proche de Chibougamau. On y accède en prenant vers le nord le chemin vers le Lac Albanel sur 20 kilomètres à partir de Chibougamau, et par la suite la Route du Nord sur 275 kilomètres (Figure 1). Il est aussi possible de s'y rendre à partir de Matagami par la Route de la Baie James. L'intersection de ces deux routes est au kilomètre 275 de la Route de la Baie James. À partir de l'intersection entre la Route de la Baie James et la Route du Nord, la propriété est située à environ 130 kilomètres (Figure 1). La propriété est traversée d'est en ouest par une ligne à haute tension (Figure 2). Un chemin d'accès permet de longer la rive est du Lac des Montagnes, alors qu'un autre chemin d'accès permet d'accéder au dépôt de lithium Whabouchi (Figure 2).

C) INFRASTRUCTURE

Le Relais Routier Nemiscau, situé à 15 kilomètres à l'ouest de la propriété, est opéré par la Compagnie de Construction et de Développement Crie (CCDC) et offre des services de restauration, de logement et d'entretien de machinerie légère et lourde (Figure 2). Hydro-Québec possède des infrastructures dans le secteur, comprenant les stations électriques Nemiscau et Albanel, situées respectivement à 15 kilomètres à l'ouest et 15 kilomètres à l'est de la propriété Whabouchi (Figure 2). L'aéroport de Nemiscau est desservi par des vols réguliers d'Air Creebec à partir de Montréal via Chibougamau et par des vols nolisés (Figure 2).

D) CLIMAT

Le climat de la région est typique du moyen nord Québécois, soit des températures moyennes de -20°C en janvier et de 17°C en juillet. Les températures estivales atteignent parfois plus de 30°C et des températures hivernales avoisinent les -40°C sur de courts laps de temps. La période de gel débute habituellement tôt en novembre, pour se prolonger jusqu'à la fin du mois d'avril.

4. HISTORIQUE

(Les parties qui suivent sont montées à partir des rapports de Pearse (2011), Laferrière (2010) et Théberge (2009).)

A) TRAVAUX ANTÉRIEURS EFFECTUÉS PAR LE GOUVERNEMENT DU QUÉBEC

Le gouvernement du Québec a effectué plusieurs campagnes et études géologiques dans la région de la Baie James. Des rapports géologiques réalisés dans les années 60, répertoriés sous les noms RP 518, Valiquette (1964), et RP 534, Valiquette (1965), et par la suite intégrés dans un rapport géologique sur la région de la rivière Némiscau intitulé RG 158, Valiquette (1975), sont très utiles car ils couvrent l'ensemble de la propriété Whabouchi. Les cartes réalisées par Valiquette dans ces rapports sont encore largement utilisées à ce jour.

En 1998, le gouvernement du Québec a publié les résultats d'un levé régional de sédiments de fond de lac effectué en 1997, MRN (1998). En 2010, les résultats d'une réanalyse de plus de 27000 échantillons collectés dans la région de la Baie James ont été publiés, MRNF (2010). Cette réanalyse a été faite à partir d'une méthode analytique ayant de meilleures précisions que celles utilisées précédemment et des limites de détection plus basses.

B) TRAVAUX ANTÉRIEURS EFFECTUÉS PAR LES COMPAGNIES D'EXPLORATION

Les premiers travaux d'exploration rapportés dans cette région remontent 1962 avec les travaux effectués par Canico sur une pegmatite à spodumène trouvée par les géologues du Bureau des Mines du Québec. En 1962 et 1963, cinq forages ont été réalisés, dont trois au diamant, tous sur la pegmatite. Un total de 1519 pieds (463.11 mètres) a été foré et le meilleur résultat obtenu est de 1.44% Li₂O sur 83.2 mètres, Elgring (1962).

Aucune exploration n'a été rapportée durant les dix années suivantes. En 1973, James Bay Nickel Ventures (Canex Placer) a réalisé un levé géologique de reconnaissance à grande échelle, Burns (1973). De 1974 à 1982, tous les travaux d'exploration rapportés ont été effectués par la Société de Développement de la Baie James (SDBJ). Des levés géochimiques (sédiments de lacs) à grande échelle ont eu lieu, suivis par un levé géologique de reconnaissance sur les anomalies identifiées, Pride (1974), Gleenson (1975) et Gleenson (1976). Deux programmes d'exploration réalisés en 1978 et 1980 ont respectivement porté sur l'évaluation de la pegmatite à spodumène de Whabouchi

et sur la prospection pour le lithium à l'échelle régionale, Goyer et al. (1978), Bertrand (1978) et Otis (1980). Aucun échantillonnage par rainures ou forage n'a été rapporté lors de ces campagnes. En 1981, un levé aéroporté magnétique et Input a couvert une partie de la propriété, Fortin (1981), et par la suite, en 1982, des levés géophysiques (Mag et MaxMin) ont été réalisés sur les anomalies Input dont une grille était située au sud du Lac du Spodumène, Charbonneau (1982).

En 1987, Westmin Resources a complété un levé aéroporté Dighem III dont une partie était localisé à l'est de la propriété, McConnell (1987). En 1987, Muscocho Exploration a effectué un levé magnétométrique, Brunelle (1987), et un levé VLF, Gilliatt (1987), ayant couvert tous les deux la région de la pegmatite à spodumène. Celle-ci est représentée par un faible conducteur combiné avec une faible anomalie magnétique associée au basalte encaissant.

En 2002, Inco a mené un programme d'exploration pour le tantale et la pegmatite à spodumène a été échantillonnée (11 échantillons par rainures et 7 échantillons choisis). Le meilleur résultat obtenu a été de 0.026% Ta, et les valeurs en Li_2O ont varié de 0.3% à 3.72%, Babineau (2002).

En septembre 2009, Nemaska Exploration a débuté ses travaux sur la pegmatite à spodumène, nommé projet Whabouchi. Un rapport technique NI 43-101, Théberge (2009)², a tout d'abord été réalisé. Lors de la visite sur le terrain le 20 septembre 2009, plusieurs affleurements de pegmatite ont été observés et neuf échantillons choisis ont été prélevés pour être analysés pour le Li_2O et BeO . Les teneurs en Li_2O obtenues varient de 1.18% à 6.3%. Par la suite pour l'automne 2009 le 10 octobre a débuté une campagne de 700 m de tranchées et le 17 octobre a commencé une campagne de 7 forages. Ces travaux de tranchées et de forages de l'automne 2009 ont démontré la continuité des dykes minéralisés en spodumène sur une longueur de 1100 m et dans le forage WHA-09-03 une interception de 101 m (80 m vraie épaisseur) à 1.64% Li_2O . En 2010, le 14 janvier a débuté une nouvelle campagne de 59 forages. Au mois de mai la compilation de ces travaux de tranchées (27 rainures) et de ces 66 forages (12 755 mètres) par par Geostat, Laferrière (2010)³ permettent un calcul de ressources minérales pour le projet Whabouchi de 9.8 million de tonnes mesurées et indiquées à 1.63% Li_2O et 15.4 million tonnes présumées à 1.57% Li_2O , 155 ppm BeO .

² THÉBERGE, D. (2009). NI 43-101 Qualifying Report, Whabouchi Property, James Bay Area, NTS Sheet 32O/12, prepared by Solumines for Nemaska Exploration inc. GM 64710.

³ LAFERRIÈRE, A. (2010). NI 43-101 Technical Report, Mineral Resource Estimation, Whabouchi Lithium Deposit, prepared by SGS Canada Inc. (Geostat) for Nemaska Exploration Inc.

Une étude minéralogique de haute définition a également été réalisée par Geostat, Laferrière (2010), sur six échantillons composites provenant d'échantillons de forage. Les analyses ont été effectuées par diffraction aux rayons-X (XRD) et par QEMSCAN™ (Quantitative Evaluation of Minerals by SCANNing electron microscopy). Cette étude a confirmé la possibilité de produire un concentré de lithium par séparation densimétrique de 6% Li₂O et un concentré de haute teneur par flottation.

De plus, toujours en 2010, Nemaska Exploration a réalisé un levé géophysique magnétique au sol, Boileau (2010)⁴, totalisant 14.7 kilomètres linéaires couvrant l'ensemble du projet Whabouchi. Un levé hélicoptère magnétique de 670 kilomètres linéaires sur toute la propriété Whabouchi a aussi été effectué, Létourneau et al. (2010)⁵. En mai 2010, une route d'accès de 1.2 kilomètre reliant le projet Whabouchi à la Route du Nord a été mise en place, et une campagne de tranchée a permis d'exposer le contact sud de la pegmatite sur une longueur de 700 mètres. À l'automne 2010, une campagne de tranchées a permis l'échantillonnage de 23 rainures totalisant 650 mètres. Celle-ci a été suivie par une campagne de 58 forages pour un total de 11 873.5 mètres qui s'est terminée au printemps 2011. Les résultats de ces campagnes de tranchées et forages permettent un nouveau calcul de ressources minérales pour le projet Whabouchi par Geostat, Laferrière (2011)⁶ de 25.1 million de tonnes mesurées et indiquées à 1.54% Li₂O, 140 ppm BeO et 4.4 million de tonnes présumées à 1.51% Li₂O, 136 ppm BeO.

En 2011, une étude économique préliminaire a été réalisée pour le projet Whabouchi par Equapolar Consultants, Pearse (2011)⁷, en collaboration avec BBA et Génivar. Celle-ci tient compte des résultats d'essais métallurgiques sur un échantillon en vrac d'environ 1 tonne afin d'obtenir un concentré de spodumène et de le transformer par la suite en carbonate de lithium de qualité batterie

utilisé dans l'industrie de l'automobile électrique. Ce rapport conclut que le projet est économiquement viable et qu'il est justifié d'entreprendre les essais en usine pilote ainsi que l'étude de faisabilité définitive.

5. CONTEXTE GÉOLOGIQUE

(La section qui suit est modifiée de Théberge (2009).)

A) GÉOLOGIE RÉGIONALE

La propriété Whabouchi est située dans la partie nord-est de la province géologique du Supérieur, qui elle se situe en plein cœur du Bouclier canadien. La province du Supérieur s'étend du Manitoba jusqu'au Québec et est composée principalement de roches d'âge Archéen. Le métamorphisme régional est au faciès des schistes verts, mais les alentours des corps intrusifs peuvent aller jusqu'au faciès des amphibolites, voire des granulites. Au Québec, la partie Est de la province du Supérieur est divisée en plusieurs sous-provinces, soit du sud vers le nord : Pontiac, Abitibi, Opatica, Nemiscau, Opinaca, La Grande, Ashuanipi, Bienville et Minto, Hocq (1994). Selon Card et Ciesielski (1986), la région couverte dans ce rapport est située dans la sous-province de Nemiscau ou d'Opinaca. La Figure 4 montre la position de la propriété Whabouchi dans la province du Supérieur.

B) GÉOLOGIE LOCALE

La propriété Whabouchi est située dans la formation volcano-sédimentaire du Lac des Montagnes, entre les granitoïdes et orthogneiss du Lac Champion et les orthogneiss et granitoïdes indifférenciés de l'Opatica NE. La ceinture volcano-sédimentaire du Lac des Montagnes est une séquence de méta-sédiments alumineux et d'amphibolite contenant des basaltes et des sills ultramafiques. Ces roches sont très cisillées et elles sont recoupées par 20% de granitoïdes tardifs (leucogranite et pegmatite à biotite). La position de la propriété ainsi que de la ceinture du Lac des Montagnes en relation avec les terranes du Lac Champion et de l'Opatica NE est présentée à la Figure 5.

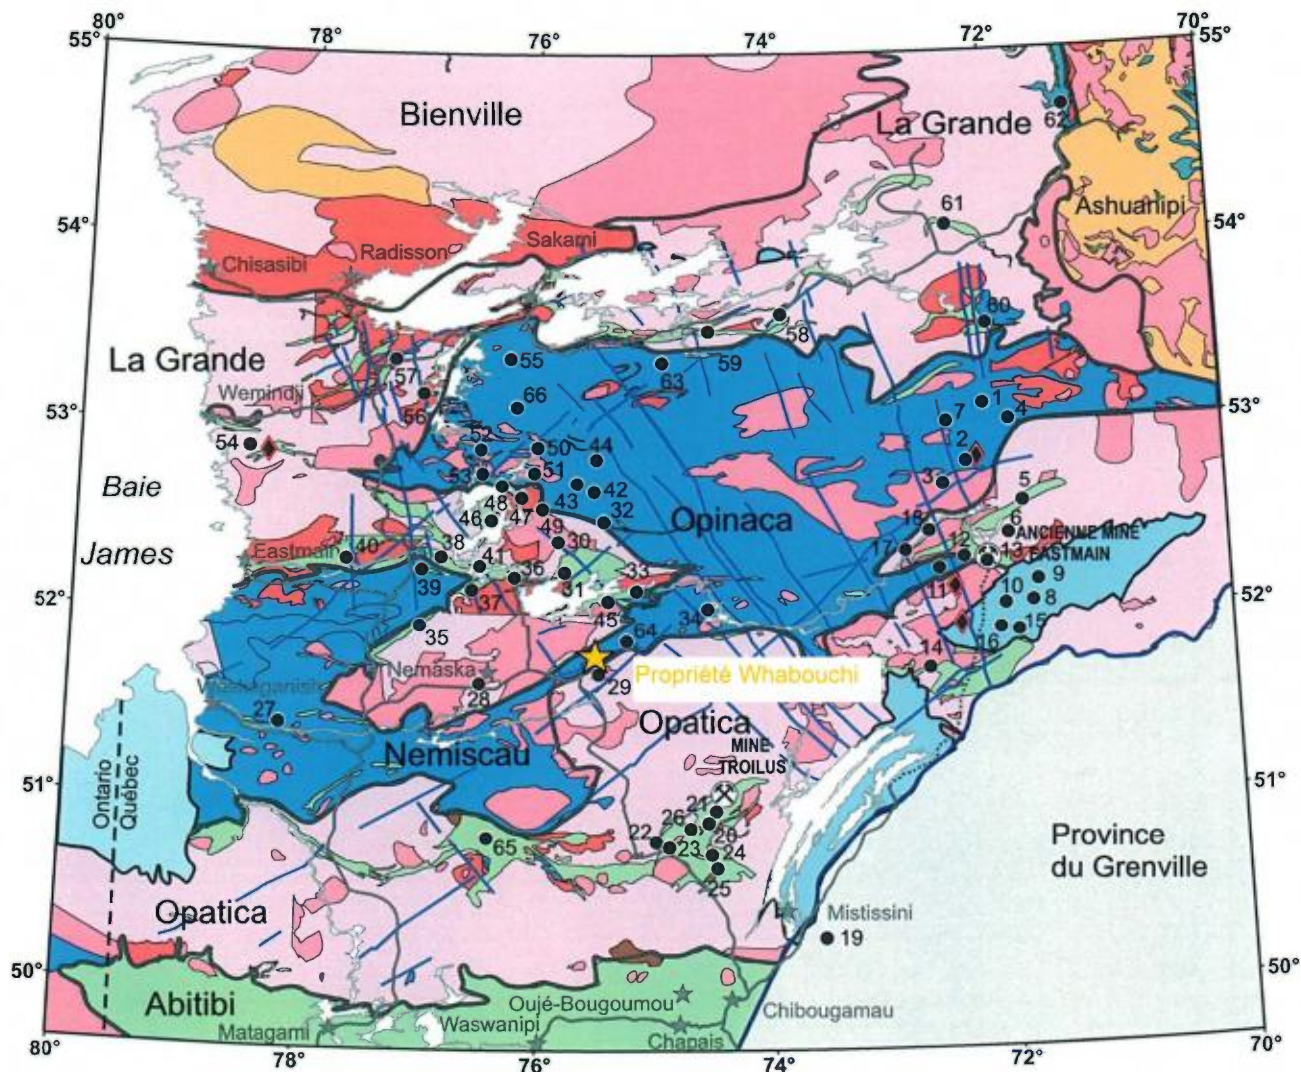

La propriété Whabouchi est localisée dans la partie nord-est de la formation du Lac des Montagnes qui a une largeur approximative de 7 kilomètres dans cette région. Du nord-ouest au sud-est (Figure 6), la propriété est formée des granitoïdes du Lac Champion, un gneiss gris à oligoclase, et finalement par la formation du Lac des Montagnes. Cette dernière couvre la partie sud-est de la propriété Whabouchi et est composée de méta-basalte au faciès amphibolite et de méta-sédiments riches en quartz, et de schistes à biotite-sillimanite-staurotide et à grenats. Le Tableau 1 résume les

différentes lithologies présentes dans la région.

Modifiée de MRNF, DV 2006-01.
Date: 4 avril 2011

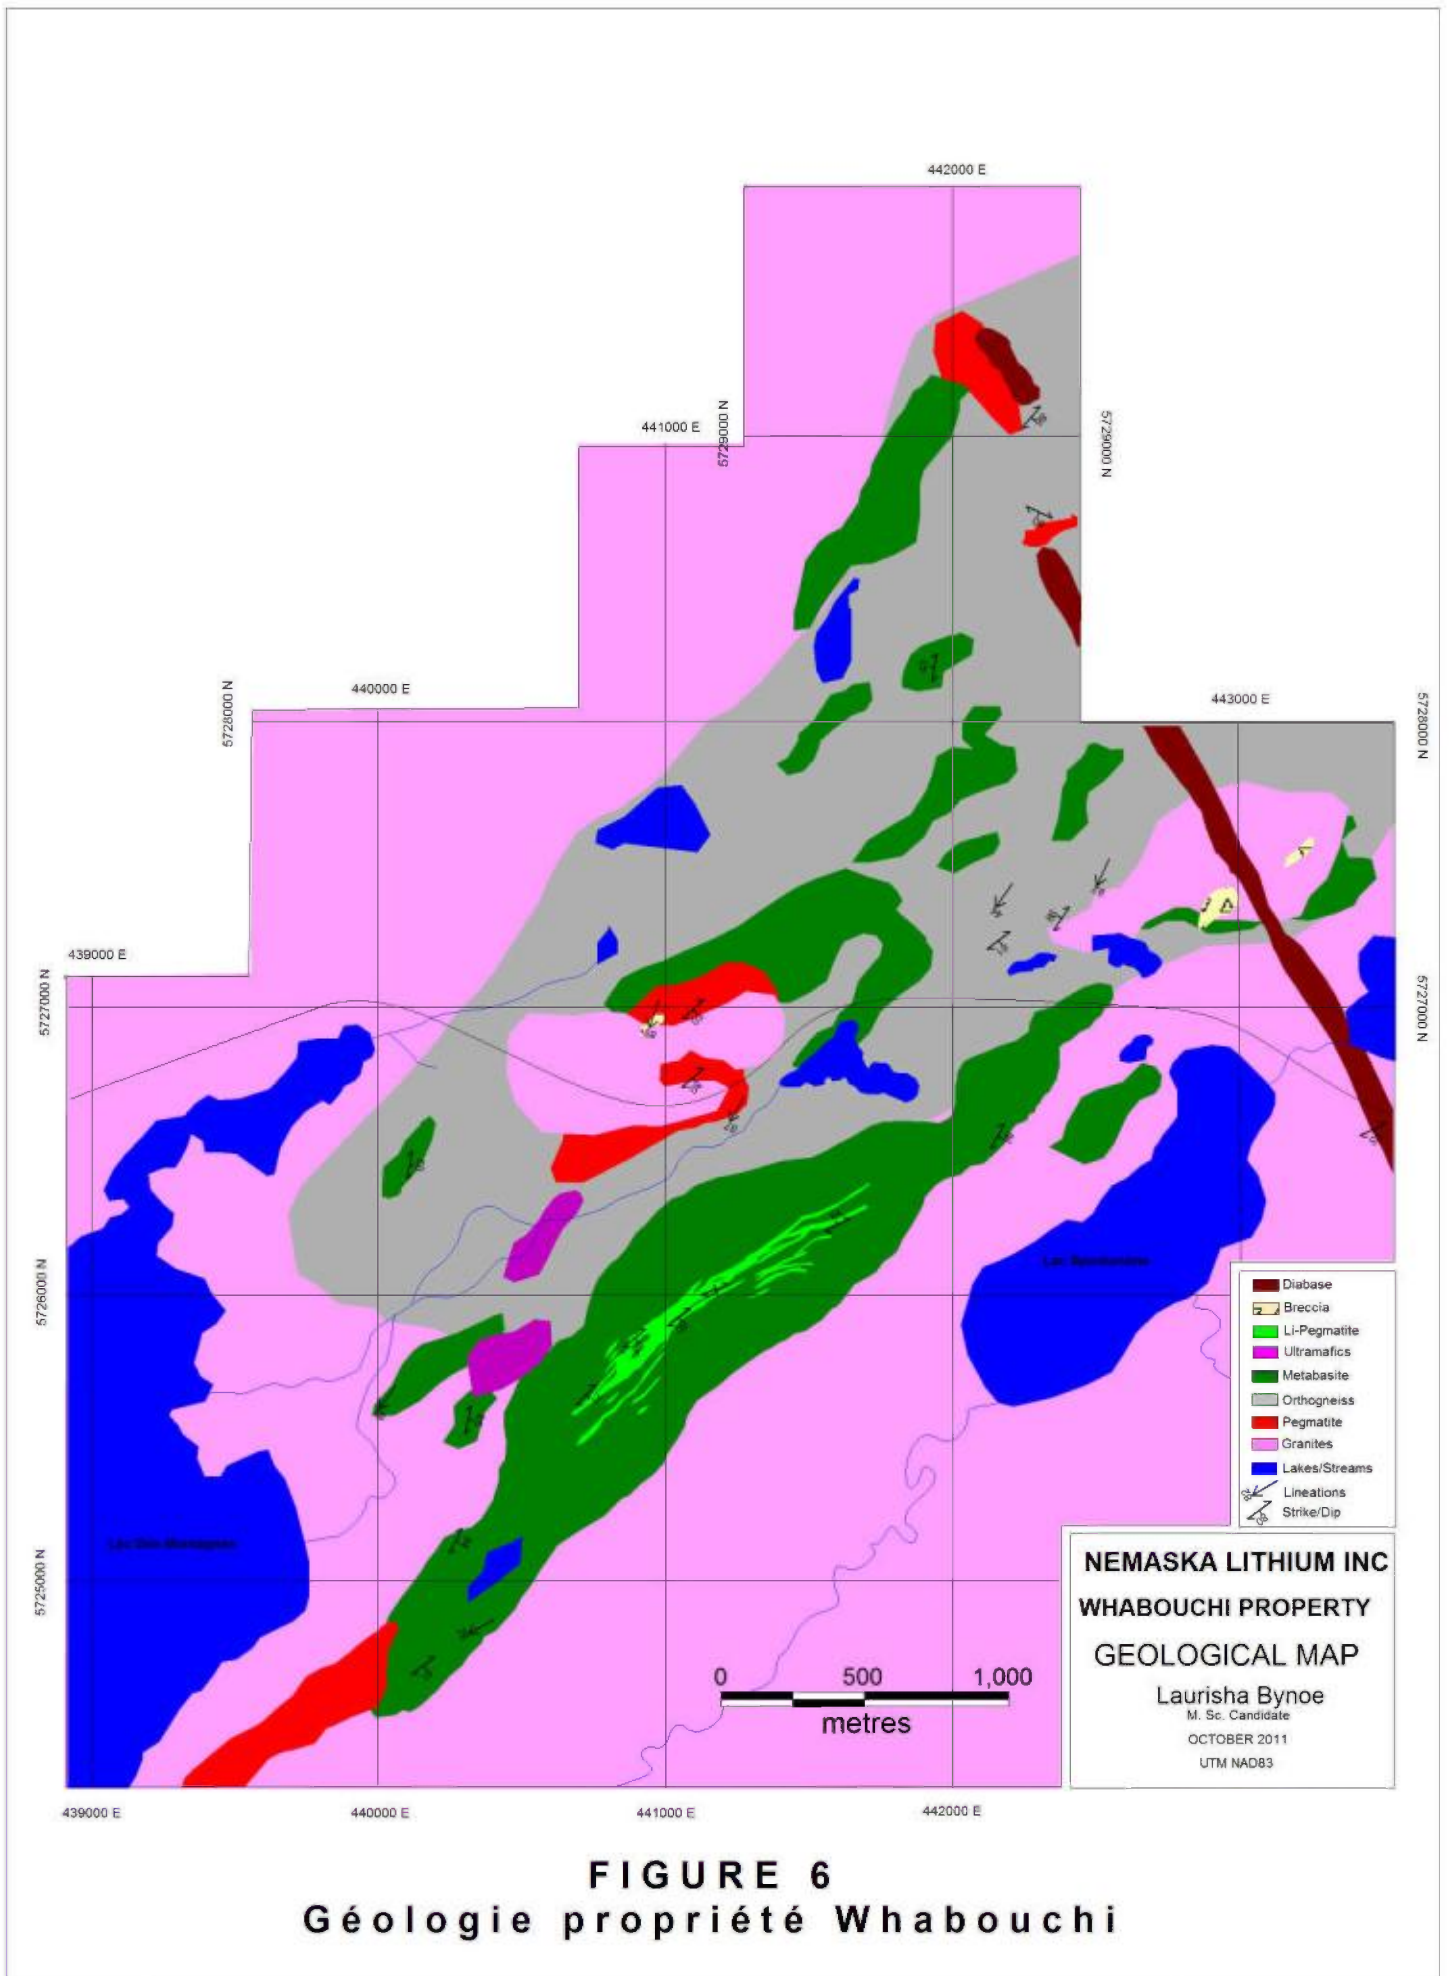

FIGURE 6
Géologie propriété Whabouchi

La pegmatite à spodumène de Whabouchi est située au centre de la propriété Whabouchi, entre le Lac du Spodumène et le Lac des Montagnes (Figure 6). La pegmatite est orientée en direction NE-SO et elle est contenue dans une bande de basalte au faciès amphibolite. Sa taille est estimée à environ 1.4 kilomètre de long par 100 mètres de large, avec une profondeur atteignant au moins 400 mètres sous la surface. Les cristaux de spodumène sont vert pâle et peuvent atteindre une taille de 30 centimètres.

6. TYPE DE GÎTE MINÉRAL

(La section qui suit est modifiée de Laferrière (2010).)

A) PEGMATITE À SPODUMÈNE

Le type de gîte associé à la minéralisation de lithium de la propriété Whabouchi est une pegmatite de type granitique, plus précisément une pegmatite à éléments rares dû à la présence de spodumène. Ces pegmatites se retrouvent généralement dans un environnement géologique composé de terranes ayant été soumis à un métamorphisme d'intensité modérée et plus souvent en périphérie de vastes plutons granitiques, dont les pegmatites sont souvent dérivées du granite parental, Sinclair (1996). La taille des pegmatites peut varier de quelques mètres à quelques centaines de mètres de long, avec une largeur allant de quelques centimètres à plusieurs centaines de mètres. Les pegmatites à éléments rares peuvent contenir une structure interne complexe, sous forme de zones généralement concentriques. De l'extérieur vers l'intérieur, on retrouve une zone de bordure, une zone d'éponte, des zones intermédiaires et une zone centrale. La zone de bordure est généralement mince et présente une texture aplitique. La zone d'éponte, composée principalement de quartz, feldspath et muscovite, est plus large et à grain plus grossier. Elle marque l'apparition des cristaux de grande taille qui caractérisent les pegmatites. Les zones intermédiaires, lorsque présentes, montrent une minéralogie plus complexe et contiennent une certaine variété de minéraux d'importance économique tels que du mica en feuillets, du béryl, du spodumène, de l'amblygonite, de la lépidolite, de la columbite-tantalite et de la cassitérite. Les minéraux dans les zones intermédiaires peuvent parfois atteindre des dimensions allant de quelques mètres à quelques dizaines de mètres. La zone centrale se compose principalement de quartz, soit sous forme d'amas solides ou de cristaux automorphes. Les pegmatites à éléments rares qui sont associées à des intrusions granitiques présentent généralement une distribution zonale autour de ces intrusions. En général, les pegmatites les plus enrichies en métaux rares et en composants volatils sont les plus éloignées des intrusions. Les pegmatites à éléments rares sont généralement formées par cristallisation primaire d'un bain magmatique siliceux riche en constituants volatils apparenté à des

magmas granitiques hautement différenciés. La lithologie des roches sources exerce un rôle majeur dans la composition ultime des pegmatites à éléments rares. Le projet Greenbushes, appartenant à Talison Lithium, est le dépôt le plus important de lithium dans des pegmatites à spodumène et il est situé en Australie.

7. TRAVAUX EFFECTUÉS

A) DESCRIPTION DES TRAVAUX

Du 10 octobre 2009 au 27 mai 2011 Nemaska Exploration a effectué 3 campagnes de tranchées et 3 campagnes de forages.

La première campagne de tranchées s'est effectuée du 10 au 28 octobre 2009. 700 m de tranchées ont été effectués desquelles 295 m de rainures ont été prélevés. Ces rainures sont numérotées R-01 à R-27. Un total de 680 analyses y a été effectué. La description des analyses est faite dans l'Annexe 2. La localisation des échantillons des tranchées est indiquée sur les plans 03 à 18 de localisation des tranchées en Annexe 6. Les certificats d'analyse sont en Annexe 3. Les paramètres des rainures sont indiqués dans le Tableau 2 et les coordonnées des échantillons sont indiquées dans le Tableau 3.

La première campagne de forage s'est effectuée du 17 au 30 octobre 2009. 7 forages numérotés WHA-09-01 à 07 totalisent une longueur de 999.1 m. Un total de 1013 analyses y a été effectué. La description des analyses est faite dans l'Annexe 2. Les paramètres des forages sont indiqués dans le Tableau 4. La localisation des forages est indiquée sur le plan 01 de localisation des forages en Annexe 6. Les certificats d'analyse sont en Annexe 3.

La deuxième campagne de forage s'est effectuée du 14 janvier au 29 avril 2010. 59 forages numérotés WHA-10-08 à 67 totalisent une longueur de 11756 m. Un total de 6128 analyses y a été effectué. La description des analyses est faite dans l'Annexe 2. Les paramètres des forages sont indiqués dans le Tableau 4. La localisation des forages est indiquée sur le plan 01 de localisation des forages en Annexe 6. Les certificats d'analyse sont en Annexe 3.

La deuxième campagne de tranchées s'est effectuée du 27 avril au 10 juin 2010 pour une longueur de 700 m. Cette période a été consacrée à dégager et laver ces tranchées. Il n'y a pas été effectué de rainures qui ont été reporté à la campagne de l'automne 2010.

124 forages							TOTAL	24628.6

La troisième campagne de tranchées s'est effectuée du 12 octobre au 12 novembre 2010. 2800 m de tranchées ont été effectuées desquelles 669 m de rainures ont été prélevées. Ces rainures sont numérotées R-125 à R-900. Un total de 721 analyses y a été effectué. La description des analyses est faite dans l'Annexe 2. La localisation des échantillons des tranchées est indiquée sur les plans 03 à 18 de localisation des tranchées en Annexe 6. Les certificats d'analyse sont en Annexe 3. Les paramètres des rainures sont indiqués dans le Tableau 2 et les coordonnées des échantillons sont indiquées dans le Tableau 3.

La troisième campagne de forage s'est effectuée du 5 novembre 2010 au 27 mai 2011. 58 forages numérotés WHA-10-68 à WHA-11-124 totalisent une longueur de 11873.5 m. Un total de 4565 analyses y a été effectué. La description des analyses est faite dans l'Annexe 2. Les paramètres des forages sont indiqués dans le Tableau 4. La localisation des forages est indiquée sur le plan 01 de localisation des forages en Annexe 6. Les certificats d'analyse sont en Annexe 3.

B) RÉSULTATS ET INTERPRÉTATION

L'ensemble des travaux de tranchées et de forages effectués par Nemaska Exploration du 10 octobre 2009 au 27 mai 2011 ont permis d'établir un modèle en trois dimensions des dykes de pegmatite minéralisés en spodumène (pyroxène de lithium $\text{LiAlSi}_2\text{O}_6$) et d'y effectuer un calcul de ressources.

Les dykes minéralisés en spodumène consistent d'une roche blanche contenant généralement 20% de cristaux de spodumène vert pâle. Les cristaux de spodumène sont aciculaires généralement de 1 cm de diamètre par 5 cm de long (Figure 7, 8 et 13). Par endroit le spodumène peut atteindre 5 cm de diamètre par 100 cm de long. La roche blanche des dykes de pegmatite consiste généralement de :

- 20% de cristaux de quartz translucide gris de 5 à 50 mm (Figure 9)
- 50% de cristaux de feldspath généralement blanc, mais parfois rosé à rose, de 30 à 100 mm, parfois un certain pourcentage en méga cristaux de 100 à 300 mm (Figure 10)
- 30% d'albite blanche généralement aphanitique
- 1 à 10% de mica pâle à bronzé (muscovite) de 10 à 50 mm
- Trace à 1% de grenat rouge foncé de 1 à 3 mm (Figure 13)
- Trace de béryl bleu pâle laiteux de 3 à 20 mm (Figure 11 et 12).

La pegmatite est généralement hétérogène (Figure 14) et les teneurs de spodumène varie de 0 à 50%, de quartz fumé de 5 à 50%, les cristaux feldspath de 5 à 80 % et d'albite de 5 à 95 %. Cependant la teneur moyenne de lithium sur l'ensemble du gisement est semblable comme l'indique la longitudinale du calcul de ressources de mai 2011 (Figure 15) par Geostat, Laferrière (2011)⁹. Cela indique que l'hétérogénéité de la pegmatite est semblable sur l'ensemble du gisement.

Les dykes de pegmatite à spodumène se retrouvent dans une bande de méta-basalte d'environ 0.5 km de large par 3.6 km de long orienté nord-est à 060 degré (Figure 6). Le méta-basalte est métamorphisé au faciès amphibolite, d'où l'unité d'amphibolite des rapports publiés de la région du Lac Des Montagnes. Les dykes de pegmatite à spodumène sont eux-aussi orientés nord-est à 060 degré avec un pendage vers le sud-est de 70 à 80 degré tel qu'indiqué sur le jeu de sections en Annexe 5. Les dykes de pegmatite se trouvent au centre de la bande de méta-basalte (Figure 6) et s'étendent sur une largeur de 100 m par une longueur de 1400 m (Plan 02 en Annexe 6). Le groupe de dykes de pegmatite à spodumène est formé par un dyke principal de 40 à 80 m d'épaisseur situé du côté nord-ouest et de deux groupes de dykes secondaires d'environ 10 m d'épaisseur situés au sud-ouest et nord-est (Figure 6, Plan 02 en Annexe 6 et jeu de sections en Annexe 5).

C) EXÉCUTEURS DES TRAVAUX

Les campagnes de tranchées et de forages ont été faites par une équipe dirigée par le consultant Yvan Bussières, ingénieur géologue. Le Tableau 5 présente tous les membres de l'équipe impliqués dans ces campagnes.

Tableau 5: Équipe de Nemaska Exploration inc

Poste	Nom
Consultant	Yvan Bussières
Géologue ou ingénieur	Ramin Salkhi, Nabil Tarbouche, Denis Raymond, Donald Théberge, Gaston Hardy, Sophie Martel, Maryse Dugas, Simon Auclair
Géologue stagiaire ou ingénieur junior	Louis-Philippe Richard, Maude Lévesque Michaud, Audrey Roussel, Lorelle Binnion
Technicien	Gabriel St-Pierre, Daniel Mercier, Lise Gravel, Alexandre Lachapelle, Sonny Gareau, Patrick Després, John Graham, Jean François Fournier, Frédéric Cotton, Donald Michaud, Jacque Tanguay, Charles Roy, Mathieu Pépin
Autochtone	Billy Swallow, Paul Swallow, Benjamin Jolly, Thomas Jolly, Clarence Jolly, Kevin Miascum, Boby Kistabiche, Jimmy Whapachee, Ryan Cheezo, Shane Decoursay

La campagne de tranchée de l'automne 2009 a été réalisée avec une pelle mécanique Kubota ½ vg³ de la compagnie Exploration GYG Ltée de La Macaza. Les campagnes de tranchée de printemps et d'automne 2010 ont été réalisées avec une pelle mécanique Komatsu 138U de la compagnie d'excavation Giroux et Fils de Rouyn-Noranda.

Les campagnes de forage ont toutes été réalisées avec une foreuse hydraulique de Forage NQ inc de Montréal.

8. MÉTHODE D'ÉCHANTILLONNAGE

A) ÉCHANTILLON DE TRANCHÉE

Lors des campagnes de tranchée, des rainures étaient effectuées dans les tranchées pour échantillonner les dykes de pegmatite (Figure 16). Ces rainures consistent de deux traits de scie à roche espacés d'environ 3 cm sur une profondeur de 5 cm (Figure 17 et 18). L'échantillonnage effectué avait pour but d'évaluer la teneur Li, Be et Rb des dykes de pegmatite. Une partie des échantillons ont été analysés aussi pour les autres éléments dans le but de vérifier si ces pegmatites avait des teneurs en Ta, Nb, etc.

Lorsque les deux traits de scie à roche étaient effectués (Figure 19), avec un ciseau à froid et une masse on cassait la languette de roche entre les traits de scie (Figure 18) pour mettre l'échantillon à l'intérieur de sacs de plastique soigneusement fermés et identifiés. Le poids moyen est de 6 kilogramme par échantillon. La localisation de chaque échantillon est enregistrée à l'aide d'un GPS (Garmin GPSmap 60Cx). Chacune des étapes de l'échantillonnage est effectuée sous la supervision d'un géologue qui s'occupe également de mettre à jour la compilation des échantillons de façon quotidienne.

B) ÉCHANTILLON DE FORAGE

Le forage effectué avait pour but d'échantillonner les dykes de pegmatite. L'échantillonnage de la carotte de forage consiste à fendre longitudinalement celle-ci en deux parties à l'aide d'une scie (Figure 20). L'échantillonnage effectué avait pour but d'évaluer la teneur Li, Be et Rb des dykes de pegmatites. Une partie des échantillons ont été analysés aussi pour les autres éléments dans le but de vérifier si ces pegmatites avait des teneurs en Ta, Nb, etc.

Lors de la description de la carotte dans les journaux de sondages, le géologue identifiait les dykes de pegmatite. Dans les dykes de pegmatite le géologue identifiait les zones de minéralisation en spodumène. Les échantillons avaient généralement 1 mètre (Figure 21). On ajoutait un échantillon dans la roche encaissante avant et après le dyke de pegmatite pour un contrôle lithologique.

Figure 16: Rainure dans tranchée

Figure 17: Rainure dans pegmatite

Figure 18: Échantillon de rainure

Figure 19: Rainurage avec scie à roche

Figure 20: Scie à carotte de forage

Figure 21: Échantillonnage carotte de forage

Figure 22: Ensachage échantillon de forage

Figure 23: Sacs d'échantillon près au transport

Les échantillons ont été déterminés par le géologue lors de la description des carottes dans les journaux de sondage. C'est une équipe de techniciens sous la direction du géologue qui a fendu les échantillons. Une moitié de l'échantillon demeure dans la boîte de carotte comme témoin, l'autre étant mise dans un sac en plastique pour expédition au laboratoire (Figure 22). Ces échantillons ont été soigneusement ensachés dans des sacs de plastique numérotés et un identifiant cartonné a été ajouté à l'intérieur des sacs pour éviter toute erreur d'identification des échantillons.

Le poids moyen est de 3 kilogrammes pour les échantillons de carotte fendue en deux de dimension NQ. Une partie des forages sont de dimension HQ et la deuxième partie a été sciée en deux pour laisser un quart de carotte dans les boîtes de carotte de forage (Figure 20). Le poids moyen est de 6 kilogrammes pour les trois quart d'échantillons de carotte de dimension HQ. La raison pour laquelle il a été fait du forage de dimension HQ était d'avoir plus de matériel pour des essais métallurgiques.

9. PRÉPARATION, ANALYSE ET SÉCURITÉ DES ÉCHANTILLONS

A) PRÉPARATION DES ÉCHANTILLONS

Les équipes de Nemaska Exploration préparent les envois d'échantillons. Les échantillons sont mis dans des sacs soigneusement fermés et identifiés (Figure 23) pour être transporté à Chibougamau à la Table Jamésienne de Concertation Minière (TJCM) où ils sont préparés pour l'analyse. La préparation des échantillons a varié durant la période d'octobre 2009 à mai 2011.

I) PRÉPARATION D'ÉCHANTILLONS D'OCTOBRE 2009 À OCTOBRE 2010

Pour cette période l'ensemble de l'échantillon est concassé et seulement quelques centaines de grammes (représentatifs de l'échantillon) sont pulvérisés. Les échantillons de pulpe sont ensuite envoyés au laboratoire de SGS Canada inc. de Lakefield de l'Ontario par le service sécurisé de Poste Canada.

II) PRÉPARATION D'ÉCHANTILLONS DE NOVEMBRE 2010 À JANVIER 2011

Pour cette période l'ensemble de l'échantillon est concassé selon un protocole permettant de

préparer l'échantillon pour des tests métallurgiques. En fait ce protocole consiste à concasser l'échantillon en deux phases qui produit au final moins de matériel fin pour les tests métallurgiques. C'est un quart du matériel plus grossier qui est utilisé pour être concassé de façon conventionnelle et seulement quelques centaines de grammes (représentatifs de l'échantillon) sont pulvérisés. Les échantillons de pulpe sont ensuite envoyés au laboratoire de SGS Canada inc. de Lakefield de l'Ontario par le service sécurisé de Poste Canada.

III) PRÉPARATION D'ÉCHANTILLONS DE FÉVRIER 2011 À MARS 2011

Pour cette période c'est le laboratoire d'analyse qui change. Les échantillons de pulpe sont envoyés au laboratoire d'ALS Canada Ltd. de Val D'Or par le service sécurisé de Poste Canada. La préparation consiste à concasser l'ensemble de l'échantillon selon un protocole permettant de préparer l'échantillon pour des tests métallurgiques. En fait ce protocole consiste à concasser l'échantillon en deux phases qui produit au final moins de matériel fin pour les tests métallurgiques. C'est un quart du matériel plus grossier qui est utilisé pour être concassé de façon conventionnelle et seulement quelques centaines de grammes (représentatifs de l'échantillon) sont pulvérisés pour expédition au laboratoire.

IV) PRÉPARATION D'ÉCHANTILLONS D'AVRIL 2011 À MAI 2011

Pour cette période on revient à la préparation originale étant donné que la période des essais métallurgiques est terminée. La préparation consiste à concasser l'ensemble de l'échantillon et seulement quelques centaines de grammes (représentatifs de l'échantillon) sont pulvérisés. Les échantillons de pulpe sont ensuite envoyés au laboratoire d'ALS Canada Ltd. de Val D'Or par le service sécurisé de Poste Canada.

B) ANALYSE DES ÉCHANTILLONS

Le laboratoire SGS Canada inc. de Lakefield de l'Ontario traite les échantillons envoyés pour les méthodes d'analyse ICM-90A et ICP90Q. Le laboratoire ALS Canada Ltd. de Val D'Or s'occupe des échantillons soumis aux méthodes d'analyses Li-OG63, ME-ICP61, ME-XRF05, ME-MS41, ME-MS81 et PGM-ICP23.

La méthode d'analyse ICM-90A (55 éléments) est appliquée par le laboratoire de SGS Canada

Inc¹⁰. Cette méthode est tout spécialement appropriée aux échantillons de pegmatite à spodumène car le fondant utilisé est du peroxyde de sodium et la fusion s'effectue à une température plus basse permettant ainsi d'obtenir les teneurs de lithium. Le dosage se fait par spectrométrie d'émission atomique à source plasma (ICP-AES) et par spectrométrie de masse à source plasma (ICP-MS). La fusion est reconnue pour être plus agressive que la digestion par l'eau régale ou par les 4 acides, s'appliquant ainsi beaucoup mieux aux minéraux réfractaires. En plus de détecter le lithium cette méthode a été utilisée sur le projet Whabouchi pour détecter si les pegmatites contiennent d'autres éléments rares comme le tantale, le niobium, etc.

La méthode d'analyse ICP-90Q (pour Li, Be et Rb) est appliquée par le laboratoire de SGS Canada Inc. Cette méthode a des limites de détection plus élevés et est donc considérée plus appropriée pour les calculs de ressources d'échantillons à haute teneur en lithium comme les pegmatites de Whabouchi. Comme pour la méthode ICM90A, le fondant utilisé est du peroxyde de sodium et la fusion s'effectue à une température plus basse permettant ainsi d'obtenir les teneurs de lithium. Le dosage se fait par spectrométrie d'émission atomique à source plasma (ICP-AES) et par spectrométrie de masse à source plasma (ICP-MS).

La méthode d'analyse Li-OG63 est appliquée par le laboratoire ALS Canada Ltd¹¹. La mise en solution de l'échantillon s'effectue par quatre acides spécialisés et le dosage se fait par spectrométrie d'émission atomique à source plasma (ICP-AES). Cette méthode a été utilisée pour les échantillons à haute teneur en lithium des pegmatites de Whabouchi et a été retenue aux calculs de ressources.

La méthode d'analyse ME-ICP41 (35 éléments) est appliquée par le laboratoire ALS Canada Ltd. La mise en solution de l'échantillon s'effectue par digestion dans l'eau régale (HNO₃-HCl 1:3) et le dosage se fait par spectrométrie d'émission atomique à source plasma (ICP-AES) et par spectrométrie de masse à source plasma (ICP-MS). Cette méthode a été retenue pour l'analyse du béryllium pour les calculs de ressources.

La méthode d'analyse ME-XRF05 (Rb) est appliquée par le laboratoire ALS Canada Ltd. La

¹⁰<http://www.mining.sgs.com/en/Analytical-Services/Chemical-Testing/Trace-Elements/Base-Metal-Assays.aspx#modalpdf><http://www.mining.sgs.com/~media/Global/Documents/Brochures/SGS-MIN-GeochemGuide2011-booklet-EN-11-V2.pdf>

¹¹<http://www.alsglobal.com/upload/minerals/downloads/fee-schedules/ALS%20Minerals-Service-Schedule-CAD.pdf>

préparation de l'échantillon consiste à produire un disque en compressant la fraction pulvérisée avec quelques gouttes d'un liant et le dosage se fait à partir de spectrométrie par fluorescence aux rayons-X (XRF). Cette méthode a été retenue pour l'analyse du rubidium des pegmatites de Whabouchi.

La méthode d'analyse ME-MS41 (55 éléments) est appliquée par le laboratoire ALS Canada Ltd. La mise en solution de l'échantillon s'effectue par digestion dans l'eau régale ($\text{HNO}_3\text{-HCl}$ 1:3) et le dosage se fait par spectrométrie d'émission atomique à source plasma (ICP-AES) et par spectrométrie de masse à source plasma (ICP-MS). Cette méthode a été utilisée pour les échantillons pour les métaux dans les forages de condamnation.

La méthode d'analyse ME-MS81 (38 éléments) est appliquée par le laboratoire ALS Canada Ltd. La mise en solution de l'échantillon s'effectue par un fondant au borate de lithium et le dosage se fait par spectrométrie de masse à source plasma (ICP-MS). Cette méthode a été utilisée pour les forages de condamnation dans le but de déterminer si les pegmatites en dehors du gîte de Whabouchi contenaient des éléments rares. Étant donné que la méthode d'analyse utilise du fondant au borate de lithium, cette méthode ne donne pas de résultat de lithium. Ces échantillons ont été analysés pour le lithium par la méthode Li-OG63.

La méthode d'analyse PGM-ICP23 est appliquée par le laboratoire ALS Canada Ltd. La préparation et le dosage pour les éléments du groupe du platine (Pt, Pd) et l'Au par la méthode se fait à partir d'un poids moyen de 30 grammes. Il s'agit d'une pyroanalyse avec fusion plombeuse. Le dosage s'effectue par spectrométrie d'émission atomique à source plasma (ICP-AES). Cette méthode a été utilisée pour quelques échantillons minéralisés en sulfures situés en dehors des pegmatites de Whabouchi dans le but de vérifier leur teneur en élément du groupe du platine et en or.

C) MESURES DE CONTRÔLE DE LA QUALITÉ DES ANALYSES

Nemaska Exploration a mis en place un contrôle de qualité des analyses à plusieurs volets dans le but de s'assurer une bonne confiance dans les calculs de ressources du gisement de lithium nommé Whabouchi.

De la période d'octobre 2009 à mai 2011, Nemaska Exploration a effectué 13191 analyses (Annexe 2) pour 9313 échantillons de rainures et forages, soit 3878 analyses de contrôle. Les analyses de contrôle représentent 29% des analyses effectuées.

Les analyses de contrôle sont de 6 types :

- Insertion de doublon dans les échantillons pour vérifier si le laboratoire répète la même teneur pour le même échantillon.
- Insertion d'échantillon composé de blanc de silice pour vérifier s'il y a contamination du laboratoire. L'analyse du blanc silice devrait donner des teneurs nulles.
- Insertion d'échantillon composé d'un standard à basse teneur en lithium pour vérifier si le laboratoire donne une teneur correspondant à la teneur prévue pour les échantillons à basse teneur en lithium.
- Insertion d'échantillon composé d'un standard à haute teneur en lithium pour vérifier si le laboratoire donne une teneur correspondant à la teneur prévue pour les échantillons à haute teneur en lithium.
- Réanalyse de certains échantillons par un autre laboratoire pour vérifier si le laboratoire utilisé donne des teneurs plus basses, égales ou plus élevées.
- Réanalyse effectuée par le laboratoire qui fait partie du contrôle interne des laboratoires.

I) INSERTION DE DOUBLON DANS LES ÉCHANTILLONS

Tout au long des 3 campagnes de tranchées et des 3 campagnes de forages Nemaska Exploration a inséré un doublon à chaque 20 échantillons. Généralement, les échantillons se terminant par 02, 22, 42, 62 et 82 étaient réservés comme doublon pour les échantillons se terminant par 01, 21, 41, 51 et 81. Ainsi ce sont 534 échantillons qui ont été séparés en deux et que la deuxième moitié a été analysée comme un échantillon avec un numéro différent (Tableau 6).

Au cours de la troisième campagne de forage en automne 2010 on a sélectionné 30 échantillons que l'on a séparés en quatre parties qui ont été analysées comme des échantillons différents

(Tableau 7). Dans ce tableau le pourcentage consiste de la différence entre la plus haute teneur moins la plus basse teneur divisé par la plus haute teneur du même échantillon $((\text{Max}-\text{Min})/\text{Max})$. Le pourcentage de variation de teneur de lithium est de 2 à 19% avec deux exceptions à 73 et 74%. Ce contrôle de qualité d'analyse démontre qui est difficile de doubler un échantillon de pegmatite minéralisé en spodumène. Une explication possible est que les cristaux de spodumène sont grossiers (généralement de 1 cm de diamètre par 5 cm de long) et causent potentiellement un effet de pépite.

Dans le tableau 6 des doublons d'échantillon le pourcentage consiste de l'analyse de l'échantillon moins l'analyse du doublon divisé par l'analyse de l'échantillon $((\% \text{Ech}-\% \text{Dou})/\% \text{Ech})$. On y retrouve 14 doublons qui ont plus que 20% de différence. On a vérifié si les doublons adjacents, c'est-à-dire dans le même certificat d'analyse sont eux aussi anomaux et cela n'est pas le cas. Cette vérification indique qu'il n'y a pas une séquence d'échantillon avec des doublons anomaux et donc qu'il n'y a pas une séquence d'échantillon dont les analyses ne se répète pas.

II) INSERTION D'ÉCHANTILLON COMPOSÉ DE BLANC DE SILICE

Tout au long des 3 campagnes de tranchées et des 3 campagnes de forages, Nemaska Exploration a inséré des échantillons composés de blanc de silice à chaque 20 échantillons. Généralement, les échantillons se terminant par 11, 31, 51, 71 et 91 étaient réservés pour les blancs de silice. Ainsi ce sont 514 échantillons composés de blanc de silice qui ont été insérés dans la séquence d'échantillon et analysés avec un numéro différent (Tableau 8).

Les teneurs en lithium des blancs de silice varient entre 0 à 0.02% Li. Ces teneurs indiquent qu'il n'y a pas eu de contamination de laboratoire.

Un certain nombre d'échantillons composés de blanc de silice ont été analysés pour multi-éléments. On y a observé que l'élément le plus sensible était le rubidium. Étant donné que la teneur en

rubidium d'une pegmatite est élevé (environ 1000 ppm) et que le seuil de détection est très bas (0.5 ppm), l'analyse du rubidium permet de détecter facilement une contamination de laboratoire par des échantillons de pegmatite.

III) INSERTION D'ÉCHANTILLON COMPOSÉ D'UN STANDARD À BASSE TENEUR EN LITHIUM

À partir du mois de février 2010, soit le forage WHA-10-22, Nemaska Exploration a inséré des échantillons composés d'un standard à basse teneur en lithium à chaque 50 échantillons. Généralement, les échantillons se terminant par 25 et 75 étaient réservés pour les standards à basse teneur en lithium. Ainsi ce sont 172 échantillons composés de standard à basse teneur en lithium qui ont été insérés dans la séquence d'échantillon et analysés avec un numéro différent (Tableau 9).

Les teneurs en lithium des standards à basse teneur en lithium varient entre 0.422 à 0.52% Li pour une teneur établie à 0.48% Li. Donc la teneur analysée des standards à basse teneur en lithium varie de -0.06% à +0.04% Li ce qui est sensiblement plus élevé que la limite de détection de 0.01% Li. L'étude statistique des échantillons de contrôle indique que la réelle limite de détection des analyses de lithium est 10% de la teneur de lithium. Ainsi un échantillon d'une teneur de 0.5% Li peut varier de plus ou moins 0.05% Li.

Tableau 9: Échantillon composé de standard à basse teneur en lithium

IV) INSERTION D'ÉCHANTILLON COMPOSÉ D'UN STANDARD À HAUTE TENEUR EN LITHIUM

À partir du mois de février 2010, soit le forage WHA-10-22, Nemaska Exploration a inséré des échantillons composés d'un standard à haute teneur en lithium à chaque 50 échantillons. Généralement, les échantillons se terminant par 00 et 50 étaient réservés pour les standards à haute teneur en lithium. Ainsi ce sont 167 échantillons composés de standard à haute teneur en lithium qui ont été insérés dans la séquence d'échantillon et analysés avec un numéro différent (Tableau 10).

Les teneurs en lithium des standards à haute teneur en lithium varient entre 0.67 à 0.81% Li pour une teneur établie à 0.74% Li, à l'exception de l'échantillon no 30100 qui a titré 0.603% Li. Donc la teneur analysée des standards à haute teneur en lithium varie de -0.07% à +0.07% Li. Cela confirme l'étude statistique des échantillons de contrôle qui indique que la réelle limite de détection des analyses de lithium est 10% de la teneur de lithium. Ainsi un échantillon d'une teneur de 0.7% Li peut varier de plus ou moins 0.07% Li.

V) RÉANALYSE DE CERTAINS ÉCHANTILLONS PAR UN AUTRE LABORATOIRE

Pour le premier calcul de ressources de printemps 2010, Nemaska Exploration a fait réanalyser chez un autre laboratoire 8 intersections de pegmatite à spodumène de 8 trous différents. On observe que la moyenne pondérée des 8 zones est généralement inférieure avec les analyses du laboratoire ALS Canada Ltd en comparaison avec les analyses du laboratoire SGS Canada Inc (Tableau 11). On observe aussi que les analyses des échantillons standards à basse et haute teneur en lithium sont elles aussi inférieures chez ALS à celle de chez SGS (Tableau 12). Donc lors de ce contrôle de qualité les analyses chez ALS ont des teneurs inférieures à celles de chez SGS (Figure 24). Par la suite, ALS s'est ajustée et les résultats des analyses des échantillons standards insérés sont revenus à la normale dans les envois d'échantillons expédiés chez ALS.

Cela démontre l'importance d'un programme de contrôle à plusieurs volets de la qualité des analyses tel que décrit au début du chapitre. Ainsi l'insertion d'échantillon standard a permis d'établir que pour cet envoi d'échantillons chez ALS les teneurs obtenus sont plus basses que ce qu'elles devraient être.

Figure 24: Graphique analyse laboratoire SGS versus analyse laboratoire ALS

VI) RÉANALYSE EFFECTUÉE PAR LE LABORATOIRE

Les laboratoires utilisés réanalysent de façon systématique un pourcentage des échantillons reçus dans le but de faire un contrôle interne de leur laboratoire. Ainsi le laboratoire SGS Canada Inc réanalyse un échantillon à chaque 10 échantillons reçus. Chez ALS Canada Ltd pour chaque 35 échantillons reçus ce sont deux échantillons qui sont réanalysés et sont insérés un échantillon de blanc de silice et un échantillon de standard.

Les résultats d'analyse de ces contrôles internes ont été conformes aux critères établis par le laboratoire.

10. CONCLUSIONS ET RECOMMANDATIONS

A) CONCLUSIONS

L'ensemble des travaux de tranchées et de forages effectués par Nemaska Exploration du 10 octobre 2009 au 27 mai 2011 ont permis d'établir un modèle en trois dimensions des dykes (Annexe 5 et Figure 15) de pegmatite minéralisés en spodumène (pyroxène de lithium $\text{LiAlSi}_2\text{O}_6$) et d'y effectuer un calcul de ressources.

Le calcul de ressources a été effectué par la division Geostat de SGS Canada Inc, (Laferrière, 2011)¹². Les ressources établies sont de 25.1 million tonnes mesurées et indiquées à 1.54% Li_2O , 140 ppm BeO et 4.4 million tonnes présumées à 1.51% Li_2O , 136 ppm BeO.

Ces ressources classent le gisement de Whabouchi comme le deuxième au monde en tonnage et en teneur pour les gisements de lithium dans la roche (Tableau 13), l'autre type de gisement étant les saumures de lacs salés. Ce classement indique que le gisement Whabouchi a le tonnage et la teneur pour être exploité économiquement.

Tableau 13: Liste des principaux gisements de lithium en pegmatite du monde

Compagnie	Projet	Tonnage Million tonnes Mesurées et indiquées	Teneur Li ₂ O %	Contenu de Li ₂ O tonnes
Talison	Green Bushes	31.4	3.10	973,400
Nemaska	Whabouchi	25.1	1.54	386,540
Canada Lithium	Quebec Lithium	29.3	1.19	348,670
Lithium One / Galaxy Res	James Bay	11.8	1.30	153,400
Corp Éléments Critiques	Rose	11.4	1.34	152,760
Galaxy Res	Mt Catlin	13.8	1.08	149,040

RECOMMANDATIONS

En étudiant la longitudinale du calcul de ressources établies par Geostat (Figure 25) on observe que la zone minéralisée commence à la section 100 E pour se poursuivre jusqu'à la section 1400 E, soit 1300 m de long et se poursuit de la surface qui est l'élévation 300 m jusqu'à l'élévation 25 m, soit 275 m de profondeur, à l'exception d'une pointe située entre les sections 412 E à 688 E qui descend jusqu'à une profondeur 575 m. Le plan 19 de la longitudinale de la zone principale (Annexe 6) montre la zone entourée en vert qui a servie au calcul de ressources. Sur le plan 19 on montre entouré en rouge les zones où du forage additionnel permettrait d'augmenter les ressources du gisement Whabouchi. Les zones de forage additionnel ont été limitées à une profondeur arbitraire de 350 m. La profondeur de 350 m est arbitraire car ce n'est que lorsque le gisement de Whabouchi sera en exploitation que l'on pourra évaluer les coûts d'exploitation et il y a environ 40 ans d'exploitation avant d'atteindre cette profondeur.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Certificate of Analysis

Work Order: TO109197

To: **Guy Bourassa**
Exploration Nemaska Inc.
450, Rue de la Gare Du Palais
B.P. 10
QUEBEC CITY
QC G1K 3X2

Date: Mar 11, 2010

P.O. No. : -
Project No. : -
No. Of Samples : 53
Date Submitted : Feb 17, 2010
Report Comprises : Pages 1 to 13
(Inclusive of Cover Sheet)

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Certificate of Analysis

Work Order: TO109288

To: **Guy Bourassa**
Exploration Nemaska Inc.
450, Rue de la Gare Du Palais
B.P. 10
QUEBEC CITY
QC G1K 3X2

Date: Mar 16, 2010

P.O. No. : -
Project No. : -
No. Of Samples : 69
Date Submitted : Feb 25, 2010
Report Comprises : Pages 1 to 13
(Inclusive of Cover Sheet)

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services (Toronto) is accredited by Standards Council of Canada (SCC) and conforms to the requirements of ISO/IEC 17025 for specific tests as indicated on the scope of accreditation to be found at <http://www.scc.ca/en/programs/lab/mineral.shtml>

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Methods marked with the @ symbol (e.g. @AAS21E) denote accredited tests

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Certificate of Analysis

Work Order: TO109354

To: **Guy Bourassa**
Exploration Nemaska Inc.
450, Rue de la Gare Du Palais
B.P. 10
QUEBEC CITY
QC G1K 3X2

Date: Mar 26, 2010

P.O. No. : -
Project No. : -
No. Of Samples : 36
Date Submitted : Mar 08, 2010
Report Comprises : Pages 1 to 7
(Inclusive of Cover Sheet)
