MAPLE GOLD MINES LTD

Forage: DO-17-192

Système de coordonnées: UTM NAD83 Zone17	Estant UTM: 706800.00	Nordant UTM: 5490270.00	Élévation UTM: 292.00 m.
	Azimut UTM: 360.00	Plongée: -50.00	Longueur: 354.00 m.
	Dimension: NQ	Zone:	Canton: DOUAY
	Débuté: 15 avr. 2017	Terminé: 18 avr. 2017	Entrepreneur: Forage Val d'Or inc
	Claim: 1133184	Cimenté: <input type="checkbox"/>	Décrit par: Jean P. BARRETTE
		Arpenté: <input type="checkbox"/>	OGQ #619

Description: Le sondage DO-17-192 (cible D17) a recoupé tout le long de ce sondage de 354m de la syénite au début sur 126 m (27-133 m) et à la fin du sondage sur 47 m (307-354 m). Entre ces deux sections de syénite peu minéralisée, des basaltes y sont présents envahie par la syénite à divers degrés d'intensités sur 174 m (133-307 m).
Trois types de minéralisations substantielles en pyrite (trace-1% de chalcopyrite) ont été observées dans ce sondage, autant dans la syénite que dans les basaltes de façon sporadique entre 114 et 274 m (166 m). Le premier type de minéralisation est associée à des basaltes et syénite de couleurs grises, fortement déformés, altérés (altération grise carbonatée) et blanchies (bleached) recoupée par des essaims de veinules tardives de quartz-carbonate-pyrite-chalcopyrite, comprenant un grain d'or visible observé à 116,30 m. On retrouve ce type de minéralisations de 114,0 - 118,9 m (4,9 m) et de 216.6 à 238,3m (21,7 m). Le deuxième type de minéralisation riche en pyrite (+/-CP) apparaît dans les enclaves de basaltes déformées et altérées ainsi que dans la syénite dans les zones de contacts cisailés entre les basaltes et la syénite altérée gris à beige. On retrouve ce type de minéralisations de 114,0-118,9m (4,9 m), de 167,9 à 169,8 (1.9 m) et de 216.6 à 238,3 m (21,7 m). Le troisième type de minéralisation se présente de façon sporadique dans un basalte prenant la forme de pyrites semi-massifs à massifs (+/- CP) présents dans la matrice de brèches hydrothermales envahie de chlorite, de carbonate et de sulfures. Les fragments de brèche de basalte sont fortement auréolés de chlorite. On retrouve de type de minéralisations de façon sporadique entre 162,3 à 194,0 m (31,7 m).

Les mesures de déviations prises lors du test de fin du trou ne sont pas bonnes. La répartition des mesures ne correspond pas à la longueur réelle du trou. Le point de départ des mesures étant la fin du trou, on considère donc que cette mesure représente la fin du trou, les autres seront ignorées.

On va donc prendre en compte, les mesures prises lors du premier test, après le casing, et la seule mesure de la fin du trou.

De	À	Description	Numéro	De	À	Long	AuCut g/t	Ag ppm	As ppm	Cu ppm	Ni ppm	Pb ppm	Sb ppm	Zn ppm
0.00	27.00	M-T - M-T - Mort terrain - 25.5 m de tubage laissé en place.												
27.00	133.57	I2D - I2D; géo2; MA; BX; AE; PG; CQ - Syénite; géo2; Roche massive; Brèche; Altéré; Pegmatitique; Cataclastique - Syénite orangée et rosée, plus rarement grise à beige, leucocrate à mésocrate, localement gris foncée verdâtre et mélanocrate. Elle est à grains fins à grossiers voir pegmatitique. Généralement porphyritique à feldspaths alcalins localement avec amph - iboles vertes dans une gangue de composition semblable si non altérée. La syénite est massive à bancs métriques à décimétriques. Elle se présente le plus souvent en brèche in-situ, ou cataclastique, à fragments de syénite et de basalte de tailles var - iables (mm's-cm's) dont la matrice est composée de matériel broyé composée de quartz fumé, de feldspaths, d'hématite, de carbonates, de chlorite, de roches/minéraux mafiques (amphibole, chlorite) et de sulfures (PY, +/- CP). La syénite est légèrement - magnétique, localement fortement magnétique dans les sections de syénite gris foncé à forte composantes mafiques. Altérations omniprésentes de carbonates, d'hématite rouge ou gris métallique (spécularite), de chlorite et localement de silice, de - séricite, de fluorite et de magnétite. Quelques enclaves de basalte observées de 27,0 à 53,75 m. Localement foliée, cisailée et mylonitique mais sur de courtes sections (< 20 cm). Contient de rares veines centimétriques de quartz blanc injectées - n, localement à microgéodes, composées de quartz, carbonate, hématite, +/- fluorine, chlorite et sulfures (>>PY, CP). Un grain d'or visible de 1mm de diam. à été observé à 114,60 m dans ce type de veine recoupant une syénite gris pâle à beige fort al	V620376	27.00	28.50	1.50	0.054	-0.50	-5.0	39	8.0	3.0		52

De	À	Description	Numéro	De	À	Long	AuCut g/t	Ag ppm	As ppm	Cu ppm	Ni ppm	Pb ppm	Sb ppm	Zn ppm	
306.55	354.00	I2D - I2D - Syénite 70° - Contact net avec la section précédente. Contient que de la syénite rouge brique, rosée à orangée et rarement gris pâle à beige. Elle est massive, de grains fins à grossiers, localement cataclastique et porphyroclastique, localement foliée. Contient - de rares petites enclaves cm'triques de basaltes en bonne partie digérés et peu minéralisés. Contient des traces de pyrite.	V620593	305.50	306.50	1.00	0.017

MAPLE GOLD MINES LTD

Forage: DO-17-194

Système de coordonnées: UTM NAD83 Zone17

Estant UTM: 706050.00

Nordant UTM: 5490640.00

Élévation UTM: 287.50 m.

Azimut UTM: 360.00

Plongée: -55.00

Longueur: 570.00 m.

Dimension: NQ

Zone:

Canton: DOUAY

Débuté: 15 avr. 2017

Terminé: 21 avr. 2017

Entrepreneur: Forage Val d'Or inc

Claim: 1133183

Cimenté:

Décrit par: Eddy Canova
OGQ #403

Arpenté:

Description: 0-27m Mort Terrain. Suivi par 27-83.7m Basalte a texture variolitique, 5-7%Vein Qtz-Carb, 0.5-2%py. Suivi a 83.7-92.4m par une Faille et breche dans les Basalte avec des bloc de Syenite, schistosite a 48° et mineralise avec 3-10%Pyrite et Trace-0.5%Chalcopryrite. Suivi par 92.4-94.5m Basalte avec injection de Syenite mineralise 2-5%Pyrite et 0.5%Chalcopryrite, 5-10%Veines de Qtz-Carb. Suivi par 94.5-149.65m Basalte magnetique altere avec 1-2%Pyrite et 0.1%Chalcopryrite (localement 4-7%Pyrite et Trace-1%Chalcopryrite). Suivi par 149.65-156.7m Basalt avec des zone rubane de sediment fin, + chert graphiteau et formation de fer magnetique avec 3-7%Pyrite et 0.1-1%Chalcopryrite. 156.7-234.5 m Basalte magnetise et injecte par la Syenite, epidotise et 1-5%Py. Suivi par 234.5-263.6m Basalte injecte par des Syenites avec alteration d'Actinolite et Sediment fin avec de la Magnetite (formation de fer), deforme, foliation a 50Deg, 2-4%Pyrite et 0.1-1%Chalcopryrite. Suivi par 263.6-304.6m Basalt avec injection de Syenite Mylonitise et 1-2%Pyrite et localement 5% pyrite. Suivi a la fin par un large sequance de 304.1-570m Syenite et avec enclave de Basalte, digestion des basalte, deforme, folie et avec 1-2%Pyrite et 2-5% Veines de Quartz-Carbonates. La deviation du trou etait de 30Deg Azimuth (358.5Deg et termine a 28Deg) et Pendage -11Deg (-55 et termine a -42).

MAPLE GOLD MINES LTD

Forage: DO-17-195

Système de coordonnées: UTM NAD83 Zone17

Estant UTM: 706800.00

Nordant UTM: 5490120.00

Élévation UTM: 292.00 m.

Azimut UTM: 357.00

Plongée: -50.00

Longueur: 450.00 m.

Dimension: NQ

Zone:

Canton: DOUAY

Débuté: 18 avr. 2017

Terminé: 22 avr. 2017

Entrepreneur: Forage Val d'Or inc

Claim: 1133184

Cimenté:

Décrit par: Nabil Tarbouche #1214
Lisa Côté #1982

Arpenté:

Description: Le forage se compose de basalte, de basalte injecté de syénite et de syénite de couleur variable. Le forage est magnétique au début. Plusieurs zones de potentielle aurifère ont été observée.

POTENTIEL AURIFÈRE (P.A.)

P.A.= De 187,25 à 188,0 avec 5-7% PY [GT-GM] disséminée et dans les microfractures

De 192,15 à 192,8 m. avec 3-5% PY [GT-GM] disséminée et dans les microfractures

De 197,25 à 197,8 m. avec 3-5% PY [GT-GM] disséminée et dans les microfractures

De 222,6 à 223,7 m. avec 3-5% PY [GT-GM] disséminée et dans les microfractures

P.A. De 381,7 à 399

Syénite de couleur beige grisâtre, rosé, fracturée

7% PY [GT-GF] dans les microfractures et disséminée

Présence de FL accompagnant les veinules de CB

Altération verdâtre pervasive

Quelques veinules de CB-QZ

Plusieurs microfractures avec altération noirâtre et contenant PY

Description: Cible D16. LOG de 6 à 525m - Résumé

Syénite multiphases, aphyrique à porphyrique en feldspaths, généralement de couleurs rose orangée à rouge brique ou gris foncé à feldspaths gris fumé, localement altérés de couleurs beige, gris pâle ou gris-vert olive. La syénite gris foncé à noir bleuté observée provient, entre autre, de la digestion d'enclaves de basalte altérées en hématite spécularite (voir unité secondaire). Généralement la syénite est à grains grossiers, localement à grains fins ou très grossiers et pegmatitique. Elle est massive et non déformée, plus fréquemment cataclastique, foliée, fissurée, fracturée, en mortier et en brèche avec injections d'autres phases de syénite et de matériel d'altérations et/ou d'hydrothermalisme (quartz, carbonate, chlorite, séricite, hématite, hématite-spécularite, épidote, fluorite, et sulfures (PY, +/- CP)). Magnétiquement faible à moyen lorsque présence de syénite gris foncé associée à digestion de basalte.

Liste complète des éléments analysés dans le fichier de la table d'analyse ajoutée au CD du rapport

De	À	Description	Numéro	De	À	Long	AuCut g/t	Ag ppm	As ppm	Cu ppm	Ni ppm	Pb ppm	Sb ppm	Zn ppm
0.00	6.00	M-T - M-T - Mort terrain - Tubage	V620630	5.60	7.00	1.40	0.029							
6.00	579.00	I2D - I2D; géo2; CQ; FO; AE; PG - Syénite; géo2; Cataclastique; Folié; Altéré; Pegmatitique - Syénite multiphasés, aphyrique à porphyrique en feldspaths, généralement de couleurs rose orangée à rouge brique ou gris foncé à feldspaths gris fumé, localement altérés de couleurs beige, gris pâle ou gris-vert olive. La syénite gris foncé à noir bl - euté observée provient, entre autre, de la digestion d'enclaves de basalte altérées en hématite spéculaire (voir unité secondaire). Généralement la syénite est à grains grossiers, localement à grains fins ou très grossiers et pegmatitique. Elle est - massive et non déformée, plus fréquemment cataclastique, foliée, fissurée, fracturée, en mortier et en brèche avec injections d'autres phases de syénite et de matériel d'altérations et/ou d'hydrothermalisme (quartz, carbonate, chlorite, séricite, hém - atite, hématite-spéculaire, épidote, fluorite, et sulfures (PY, +/- CP)). Magnétiquement faible à moyen lorsque présence de syénite gris foncé associée à digestion de basalte. Les sections minéralisées en sulfures (Tr-3% Py, Tr CP rare 1%) sont - dans une syénite cataclastique de grains fins à moyens, fracturée et altérée (CL+, CB+, SR+, Si+, HM+, FL+, FU+) de couleurs gris pâle, beige et gris-vert olive et même rouge brique. Les altérations sont pénétratives et en injections dans les structu - ves de quartz fumée, avec ou sans sulfures, de tailles cm'triques apparaissent sporadiquement. Quelques veines blanche ou gris pâle cm'trique de carbonatite possiblement (?) apparaissent également dans ce sondage, surtout à la fin du trou, Zone m - (58m); 533-552m (19m); 566-577m(11m). De 7.35 à 9.60 I2D FF - I2D FF - Syénite noire 55° - Contant franc et en brèche avec syénite précédente. Syénite noire et/ou enclave de basalte (?), cataclastique avec 15% de porphyroclastes (< 2cm) de syénite orangée disséminés dans une pâte finement broyée noire et à grains fins. Fort magnétique ave - c traces -1% de pyrite disséminées.	V620631	7.00	8.50	1.50	0.012	-0.50	-5.0	39	15.0	2.0		114

MAPLE GOLD MINES LTD

Forage: DO-17-198

Système de coordonnées: UTM NAD83 Zone17

Estant UTM: 708700.00

Nordant UTM: 5488640.00

Élévation UTM: 307.00 m.

Azimut UTM: 360.00

Plongée: -45.00

Longueur: 564.00 m.

Dimension: NQ

Zone:

Canton: DOUAY

Débuté: 22 avr. 2017

Terminé: 28 avr. 2017

Entrepreneur: Forage Val d'Or inc

Claim: 1133137

Cimenté:

Décrit par: Bernard-O. Martel

Arpenté:

OGQ #492

223.90	238.65	V3B - V3B; géo2; CS - Basalte; géo2; Cisaillé - Coninuation of the same Zone de cisaillement but slightly less strong, but strong enough to regularly develop, at short intervals, numerous black mm-cm deformation / granulation planes. In between these black planes, the strong foliation is show by l - ot of greenish micaceous minerals. In the beginning, there is more PY (1-5%) aligned along the foliation, along CB veins / microfractures. In lower parts, the presence of PY is slightly les, but it may increase along certain foliation and CB veins. - Near the end of the zone de cisaillement, we star to recognize presence of slightly coarser texure of gabbroic rocks (I3A). 448.65	463.50	S10 - S10; S10E - Chert; Chert noir carboné - Chert whitish, translucent, shows good layering in places. The black coloured rock are not like the black rock of the long interval described above. These black rocks are common in lower parts here, below 455.5 to 463.5. Sulfure are very commun i - n the rocks in this interval. PO = largely predominates PY = very common, but les than PO CP = is present in very minor amont seen associated with PO, where CP may be present near the margins of PO PO-PY = may be present together, but separately. - In place PY is se= en to be present along fractures in PO patches. SP = vere small grain and generally margins of PO PO > PY > CP = are very abundant in the black / dark coloured rocks These SF occur in aggreygates of large and small (mm - cm -) patches. Where it can be seen that the SF occupy the place where there was already presence of CB. These SF also commonly occupy microfractures. These SF also aligne along CB veins / veinlets and occur disseminated in parches oc CB Even in the - whitish, translucent cherts, the SF are present in similar contexts. MAPLE GOLD MINES LTD

Forage: DO-17-199

Système de coordonnées: UTM NAD83 Zone17

Estant UTM: 706050.00

Nordant UTM: 5490640.00

Élévation UTM: 287.50 m.

Azimut UTM: 165.00

Plongée: -52.00

Longueur: 780.30 m.

Dimension: NQ

Zone:

Canton: DOUAY

Débuté: 27 avr. 2017

Terminé: 10 mai 2017

Entrepreneur: Forage Val d'Or inc

Claim: 1133183

Cimenté:

Décrit par: Jean P. BARRETTE

Arpenté:

OGQ #619

0.00	28.65	M-T - M-T - Mort terrain - 39 m de tubage laissé en place avec cap.												
28.65	65.24	V3B - V3B; géo2; VA; AE - Basalte; géo2; Variolaire; Altéré - Basalte vert foncé à vert épidote, aphanitique, aphyrique ou à petis phénocristaux de feldspath mm'triques, magnétique moyen à fort en marges des zones d'altérations et de minéralisations (CL+, EP+, SR+, CB+, Si+, BO+). Contient des passées cm-dm'tri - ques de varioles agglomérées de couleur jaunâtre composées de feldspath (?), carbonates, silice et épidote. Ces passées variolaires siliceuses contiennent de nombreuses veinules de CB-EP-SF et plus de sulfures (1-5% PY-CP) que dans le basalte vert fo - nçé non altéré. Généralement massif, localement en brèche (tectonique ?, hydrolique ? de coulée ?) avec injections de veines et veinules minéralisées en grosse pyrites rondes (1-7 mm) de QZ-CB-CL-EP-HM-PY	V621076	28.65	30.00	1.35	0.003

Lithologies et analyses:

Liste complète des éléments analysés dans le fichier de la table d'analyse ajoutée au CD du rapport

De	À	Description	Numéro	De	À	Long	AuCut g/t	Ag ppm	As ppm	Cu ppm	Ni ppm	Pb ppm	Sb ppm	Zn ppm
0.00	39.00	M-T - M-T - Mort terrain - 35 m de tubage laissé en place avec cap.												
39.00	50.00	VC S10 - VC S10; géo2; RN - Volcanoclastique avec Chert 50°; géo2; Remanié(e) - Volcano-sedimentary rock with chert bands. Mottled medium grey to greenish grey rock with 10-25% pale greenish beige chert bands at 46-55CA. Distinct granulometric boundaries between the aphanitic bands and the fine-grained (fine sandstone?) host ro - ck. The width of bands ranges from a few mm to a few cm. The unit is non-magnetic, non-carbonaceous, with white Carb (calcite) and greyish Qz-Carb in fractures. Minor sericite in fractures associated with chert. Mineralization: traces to 1-3% Py in - fractures with Carb and Qz. An arbitrary lower contact, gradational over 10 cm.	V508087 V508088 V508089 V508090 V508092 V508093 V508094 V508095	39.00 40.50 42.00 43.50 45.00 46.50 48.00 49.00	40.50 42.00 43.50 45.00 46.50 48.00 49.00	1.50 1.50 1.50 1.50 1.50 1.50 1.00 1.00	0.001 0.001 -0.001 0.001 0.001 0.002 0.004 0.007	-0.50	35.0	46	58.0	49.0		93
50.00	58.90	S10 - S10 - Chert - Chert with minor discontinuous bands of fine-grained sediments. Light greenish beige to light and dark pinkish grey chert-like rock with minor localized dark greenish grey bands of fine-grained sediments. Aphanitic, non-carbonaceous, very hard, sili - ceous, non-magnetic in most parts except the interval near the lower contact, which becomes patchy magnetic (due to syenite injections). Moderately fractured with pinkish beige Carb-Hem and dark grey-green Carb-Qz--Chl infilling; stronger fracturing - in the lower half of the unit. Minor fibrous sericite in some fractures. Generally, the dark fractures are planar, oriented at 30-55CA and crosscut some other fractures with mm-cm offsets. Mineralization: at 50.0-51.2 m - 5-10% Py fracture-controlle - d and diss (associated with a syenite dyke); the rest of the unit has traces to 0.5-1% Py in fractures. 50.85-51.20 m - Syenite with distinct contacts at 40CA (upper) and 50CA (lower). Medium pinkish grey, medium-grained, non-magnetic, with Carb - in matrix and microfractures. Traces to 1-2% Py fracture-controlled. More pyrite is concentrated in the host rock on both contacts. 212.40	221.40	TU S GT - TU S GT; géo2; LP - Sédiments volcanogéniques 60°; géo2; Laminations parallèles - Volcaniclastic sediments, weakly to moderately laminated. Very fine-grained to aphanitic, medium grey with paler yellowish grey fine laminations. The laminations are weakly to moderately developed at 58-64CA, sub-mm to cm in width, sericitic. The roc - k is non-magnetic, non-carbonaceous, moderately soft to scratch. White Carb (calcite) fills fractures that follow the main foliation. Mineralization: traces to 1-2% Py fracture-controlled, common in calcite-filled fractures. The XRF measurements - at 215.5 m: SiO2=36 wt%, Al2O3=10.8 wt%, MgO=1.9 wt%, K2O=2.9 wt%. A distinct lower contact at 64CA.	V508226	212.40	213.00	0.60	0.001

		<p>- Sédiments fins avec tuf felsique 70°; géo2; Remanié(e) - Volcaniclastic sediments composed of reworked felsic lapilli tuff interlayered with very fine-grained tuffaceous sediments.</p> <p>Mottled medium to light grey with black and beige clasts. Moderately foliated at 65-74CA; foliation defined by fine laminat - ions and flattened clasts/lapillis. Minor fibrous yellow sericite in fractures oriented in same direction as the foliation. The coarse layers are mainly matrix-supported but locally also clast-supported. The clasts are polymictic, dominated by suba - ngular shards of black chert mm-cm in size, less commonly several cm; with subordinate white, beige and yellow clasts (~15%). The matrix is light grey, arkosic with streaks of yellowish sericite, coarser than layers without clasts. Fine-grained layer - s comprise about 10-15% of the unit, few mm to several dm in length; they are light grey, soft, finely laminated. Granulometric boundaries are typically sharp, Mineralization: traces to 2% Py disseminated, fracture-controlled, in some clasts. A few - late pyritized fractures running parallel to the core axis and cutting the foliation.</p> <p>A rather distinct irregular lower contact with yellow fibrous sericite in fractures.</p>	V508236	223.50	225.00	1.50	0.010

356.00	357.70	- ntact at 65CA. TU S GT - TU S GT; géo2; GM; RN - Sédiments volcanogéniques 75°; géo2; Grains moyens; Remanié(e) - Reworked volcanogenic sediments (volcanogenic sandstone). Mottled pink, beige, grey, olive; fine to medium-grained, dominated by felsic material. Layered and sheared at 72-85CA; foliation is defined by compositional layering, yellowish streaks of sericite, and fractures filled by fibrous sericite. Non-magnetic, mod hard to mod soft. Mineralization: 1-3% fine Py in greyish layers and in some fractures. 357.10-357.70 m - 25% colorless to white Qz-minor Carb veins, 1-10 cm wide, irregular, defined, generally following the foliation. A distinct lower contact marked by a 10 cm Qz-Carb vein.	V508350	356.00	356.85	0.85	0.062

357.70	362.00	I2D - I2D; géo2; PO - Syénite; géo2; Porphyrique - Syenite (?) or felsic volcanics (??) with a porphyritic texture. A porphyritic rock of intermediate composition. Medium to dark pink-red to mauve with dark grey patches/bands. Composed of 30-40% pinkish Feldspar phenocrysts (1-4 mm, subhedral to anhedral) surrounded by fine-grained grey groundmass. Moderate Carb in matrix and microfractures. The rock is non-magnetic, hard to scratch. Less than 1% of white Qz-Carb veinlets. Weakly sheared at 57-60CA, with fibrous Ser in fractures. Mineralization: traces to 1-2% fine Py diss in groundmass with grey Carb. 359.47-359.95 m - volcanogenic sediments (?), fine to med-grained, medium pink-beige-grey, finely foliated at 65CA; traces to 0.5% fine Py. 361.50-362.00 m - patchy epidote alteration - on Fsp phenocrysts and in matrix. A distinct lower contact at 50CA; chill margin.	V508353	357.70	359.00	1.30	0.056

MAPLE GOLD MINES LTD

Forage: DO-17-201

Système de coordonnées: UTM NAD83 Zone17

Estant UTM: 709000.00

Nordant UTM: 5488640.00

Élévation UTM: 307.00 m.

Azimut UTM: 360.00

Plongée: -50.00

Longueur: 142.35 m.

Dimension: NQ

Zone:

Canton: DOUAY

Débuté: 30 avr. 2017

Terminé: 3 mai 2017

Entrepreneur: Forage Val d'Or inc

Claim: 1133138

Cimenté:

Décrit par: Bernard-O. Martel

Arpenté:

OGQ #492

Description: Sondage abandonné. Impossible de stabiliser le tubage.
No samples.

Propriété Douay

Lithologies et analyses:

Liste complète des éléments analysés dans le fichier de la table d'analyse ajoutée au CD du rapport

De	À	Description	Numéro	De	À	Long	AuCut g/t	Ag ppm	As ppm	Cu ppm	Ni ppm	Pb ppm	Sb ppm	Zn ppm
0.00	138.85	M-T - M-T - Mort terrain - 141 m de tubage. HQ casing laissé en place.												
138.85	142.35	I2D - I2D - Syénite - Pinkish-reddish syenite. Homogeneous. Minor disseminated PY grains. EOH

0.00	68.95	M-T - M-T - Mort terrain - 77.5 m de tubage laissé en place.												
68.95	131.35	V3B - V3B; I3O - Basalte; Lamprophyre - Unité mixte. Basalt is followed sub-parralle to CA by a lamprophyre :70.0 m to 116 m = Lamprophyre Phenocrysts and 116.to 128 m = Lamprophyre aphinitc texture Lamprophyre : Dark coloured rock with phlogopite phenocrysts and generally magnetic. PY (3-5 - %) in place, there is lot of development of PY aligned along the contact Lamprophyre/basalt. PY may from on the side of Lamprophyre and also on the side od basalt. Lot of small patches is also common in Lamprophyre. Basalt is fine grained, dark gr - een in colour. There are several "Zone de cisaillement" in Basalt, which run for several cm. There are maked by a very strong foliation, the rock becomes very fine grained and there is lot of fine grained white CB injections parallel to the foliation - . PY, PO and CP (2-5%) : Both the foliation in basalt and the thin white CB layers may contain PY, PO aligned parallel to foliation. Very minors spots oc CP may also be present. S9B: In some small parts, basalt shows strong magnetism which may be - due to iron formation / accumulation of MG	V446731	69.00	70.50	1.50	0.001

646.80	648.50	S10 - S10 - Chert - Chert pale grey on core surface, when dry, but darker grey when core wet. The rock here is very rich in PY (5-7%) There are 2 kinds of PY : 1-a fine grained disseminated PY, which shows a preferred orientation, possibly indicating lamination / foliation. 2-The other kind of PY is the most abundant. This PY is present along microfractures, microfractures with white CB, veins, veinlets and large and small patches of white CB. Ther are abundant veins, patches of CB in the rock and most of contains PY.	V447192	646.80	647.50	0.70	-0.001

81.30	83.70	A distinct lower contact at 55CA. TU S GT - TU S GT; géo2; GG - Sédiments volcanogéniques 55°; géo2; Grains grossiers - Reworked volcanogenic sediments with non-sorted medium and coarse clasts. Medium greenish grey with pale beige, whitish and greenish polymictic, subangular to subround clasts. The size of the clasts varies from a few mm to a few cm; the margins are - fairly distinct. The rock is non-magnetic, mod soft to mod hard to scratch. Locally weakly-developed foliation at 55CA. Some chlorite in the matrix and basaltic clasts with leucoxene point to the resence of mafic material. Mineralization: traces to - 1-2% Py disseminated, fracture-controlled and in some clasts. A somewhat distinct lower contact at ~60CA.	V508395 V508396	81.30 82.50	82.50 83.70	1.20 1.20	0.059 0.016								
83.70	99.20	TU S GT - TU S GT; géo2; LP - Sédiments volcanogéniques 60°; géo2; Laminations parallèles - Volcanogenic sediments, fine-grained, laminated. The unit is medium grey to greenish grey with 10-20% pale yellowish beige bands and laminations that give it a mottled appearance. The matrix is fine-grained, non-magnetic, non-carbonaceous, moderatel - y soft to scratch. Bands and laminations are finer-grained to almost aphanitic, typically with distinct margins, moderately soft, sericite-rich, varying in size from mm to 1-2 cm, less commonly several cm to a few dm. Foliation is moderately developpe - d at 60-70CA (mainly 65CA). Some laminations are fractured with mm-cm displacements. Mineralization: traces to 1-2% fine Py fracture-controlled. 96.80-99.00 m - strong fracturing; foliation angles at 40-50CA (sheared interval). A fairly distin - ct lower contact at 55CA. 		Variable colour - medium to light pink, light beige. Composed of ~40% colorless anhedral to subhedral phenocrysts of feldspar (sub-mm to 1-3 mm in size) embedded in a finer-grained pinkish or whitish g - roundmass. Hematite-rich pink intervals have 1-3% disseminated tiny black grains (non-magn). Rather massive in appearance, locally weakly foliated/sheared at 45-60CA with foliation defined by fibrous sericite in microfractures. The non-foliated parts - are fractured. The angles of the dominant set of fractures range from 25 to 60CA (mainly 45-50CA). Fractures have rough and smooth surfaces; locally have rusty oxidation stains. About 1% white Qz-Carb veinlets, 1-5 mm wide; some have dissolution cavities. Mineralization: traces to 1-2% fine Py disseminated and fracture-controlled; mainly in discoloured parts. 99.20-101.80 m - weakly developed foliation at 45-55CA. A distinct lower contact marked by a 3 cm wide fault zone at 50CA.	V508417	106.50	108.00	1.50	0.002	-0.50	-5.0	8	33.0	5.0		40

337.65	356.25	<p>uniformly light beige, contain sand-size colorles - s feldspar grains in finer matrix (feldspars look more angular than phenocrysts and finer-grained). The contacts between sections are distinct by colour but not sharp. The unit is sheared with moderately developed foliation at 60-65CA defined by se - ricite fabrics in microfractures, orientation of fragments and of chloritic streaks. Mineralization: rare traces Py in fractures.</p> <p>A somewhat distinct lower contact, gradational over ~10 cm; at 65CA.</p> <p>V1D - V1D; géo2; PO - Dacite 65°; géo2; Porphyrique - Felsic porphyritic volcanics.</p> <p>Variable in colour - light beige-grey, medium grey, light to medium pink. Composed of 30-50% colorless anhedral to subhedral phenocrysts of feldspar (sub-mm to 1-2 mm in size) embedded in a finer-grained whitish or pi - nkish groundmass. The rock is non-magnetic, non-carbonaceous, very hard to scratch. Weakly to moderately sheared with weakly developed foliation at 55-65CA defined by sericite in fractures and orientation by greyish, discolored "bands". A few occas - ional colorless to white Qz-Carb veins (1-5 cm wide, irregular, with some cavities). Mineralization: 1-3% fine Py fracture-controlled and disseminated in greyish cloudy zones, which could be a few mm-cm wide (band-like) or continuous over 0.5-2 m.</p> <p>- A distinct lower contact at 80CA, marked by a 1 cm wide Qz-Carb vein.</p>	V508603	337.65	339.00	1.35	0.011
