21.00	55.40	V3B VN-I2D - V3B VN-I2D; géo2; MA - Basalte avec injection de syénite; géo2; Roche massive - Lave mafique massive, aphanitique, comprenant quelques passes de 10-20cm de brèche de coulée (montrant des fragments), verte foncée, fortement chloritisée, faiblement épidotisée. Localement carbonatisée (essentiellement aux épontes des injections de - syénite rosée). Des aiguilles sub-millimétriques de feldspath blanc peuvent être observées à la loupe. L'unité est affectée par une faille de 21m à environ 43m, ce qui donne du terrain bloquant et un faible RQD causant des problèmes aux foreurs. - Trois intervalles de boue de faille grise silteuse à 28,5m, 29.0m et 29.4m sont observées et signalées par des bouts de bois par les foreurs. De 53.8m à 55.4m: portion noire, dure, silicifiée et carbonatisée, faiblement minéralisée (0.5% à 2% de - pyrite disséminée) Contact inférieur graduel sur 20cm. Volcanite mafique massive, généralement aphanitique mais localement à texture gabbroïque, verte/grisâtre très foncée, non magnétique. Chloritisée, épidotisée et localement carbonatisée. Localement contient jusqu'à 20% de microcristaux d'un feldspath blanc en aiguilles plagioclase). Brèche de coulée par endroits. Traces de pyrite, pyrrhotine en petits grains disséminés. De 63.25 à 63.80: injection de syénite. Contact supérieur irrégulier, inférieur net à 50 degrés. Les échantillons du basalte sont fortement magnétiques sur 10cm. Portion brunâtre, bien foliée et légèrement schisteuse à 50 degrés. Fortement carbonatée. On peut observer à la loupe des feldspaths xénomorphes, à bordures floues, hématisés. De 66.35 à 66.85m - : veine de calcite grise à légèrement rosâtre, bien foliée à 50 degrés. Contient des octaèdres de magnétite gris métallique . De 100.4 à 102m: injection de syénite à demi-digérée. Contacts nets à 50 degrés. Portion bien foliée à 50 degrés, légère - ment brunâtre (hématisée), fortement magnétique et carbonatisée, avec 15% de veines de carbonate. Les lattes de feldspath blanches composent 5% de l'unité et mesurent de 3 à 11m de long. Bien orientées à 50 degrés, - leur coeur est en calcite avec une mince bordure rouge hématisée. Une autre taille de phénocristaux de feldspath compose environ 20% de l'unité (de 10% à 30% selon l'endroit): de 0.5 à 1.5mm de long, leur orientation est quelconque et leur couleur es - t beige (complètement séricitisés). Bordures de trempe de 15cm visibles aux deux contacts où les lattes de feldspath sont absentes. Fortement carbonatisé.

Presence of numerous mm to < 2 cm size fragments of QZ materiel, These pieces of QZ once were part of QZ veins injected into the basalt and subsequently were highly dismembered into smaller pieces as a result of - strong deformation affecting these basalts. These QZ fragment commonly also show the presence of FL and minor CB with PY. These Basalts are also characterized by the presence of several small CB veins-white or pinkish in color-which maybe from a f - ew cm-to-30 cm thick. PY : In some place the margins of CB veines, in contact with the basalts, may be lined with PY. Both, small and larger QZ veins may also contain disseminations of PY VN-CB are pink, homogeneous, fine grained and in contact wit - h a few cm thin QZ vein. Here the QZ vein has developed several microfractures and thes microfractures of other parts of QZ-vein contain lot of PY. 256.05	260.75	<p>- Syénite 68°; géo2; Folié - Syenite, mod foliated. Mottled mauve with dark green mm-cm bands, pinkish at contacts. Fine to med-grained, locally porphyritic; non-magn; Carb in matrix. Weak-moderately developed foliation at 65-70CA, defined by chloritic bands (alteration along f - ratures). Foliation is the same as in the surrounding rock; apparently, syenite intruded prior to main deformation. One Qz-Carb-Fluor vein. Traces Py. A distinct lower contact at 66CA.</p> <p>TL1 - TL1; géo2; FO - Tuf felsique à lapilli 68°; géo2; Folié - Felsic lapilli tuff interlayered with dacitic flows and minor sediments.</p> <p>Pale olive-grey with paler or darker flattened lapillis, in some parts medium-grey, Polymictic to monomictic. Lapillis vary in size from a few mm to a few cm; mostly not interconnected, matrix-supported. The matrix is fine-grained, carbonaceous, non-magnetic. Weakly to well-developed foliation at angles ranging from 65 to 70CA, defined by Ser fabrics, streaks of green mica, and flattened lapillis. Occasional greyish C - carb-rich zones/veins with Qz and minor Fluor, 1-5 cm wide. Traces to 1-2% fine Py in greyish Qz-Carb foliation bands/fractures; 1-3% fine Py in rims of some veins and in dark grey, high carbonate sections.</p> <p>259-270 m - Medium grey mottled interval - with a greater number of lapillis, interconnected, small "eyes", occasional Plg phenocrysts. Maybe indicative of a more violent explosive activity.</p> <p>290.85-291.60 m - Syenite, medium mauve-grey with 2-5% dark grey phenocrysts in fine-med-grained matrix, non-magn, carbonatized, no Py.</p> <p>292.80-293.70 m - Dacite flow, porphyritic, medium pink-grey with 15-25% white Plg phenocrysts in fine-grained matrix (1-3 mm, anhedral to subhedral, often broken). 		- Contacts francs à 80 degrés. Bordure de trempe de 8cm aux contacts montrant une réduction marquée de la granulométrie. Intrusif rouge brique tacheté vert pomme (épidote) formé essentiellement de feldspath hématisé. On observe deux tailles de phénocrist - aux: Les plus grands (environ 10%) atteignent 3mm et ont été complètement remplacés par l'épidote. Leur forme, prismatique à 6 côtés laisse supposer un amphibole (hornblende ?). 		- Very fine-grained, black graphitic sediments finely layered with paler grey, millimetric cherty bands (1-3% chert). Foliation is better seen in layers with chert and sulphides than in rather massive parts; typically at 25-40CA. Calcite-filled millimetric tension gashes cut the layers with 1-3 mm displacements. 2-3% white Cal veinlets are mainly concentrated near the upper contact. The unit is mineralized by 2-7% pyrrhotine as fine disseminated specks, blebs, in fractures and layers, in some gas vesicles. Traces Cpy and possibly traces Sph (brownish pink). Pyrrhotine is mainly no-magn, locally weakly magn. EOH

Veins carry fine diss Magn and 3-5% fine Py. 187.50-187.85 m - a strongly foliated/sheared interval follows the brecciated section; has distinct contacts at 60CA. Pale beige-grey, very fine-grained, magnetic on contacts. This interval resembles a felsic flow or felsic tuff but the XRF measured only 20% SiO2. Could be highly altered basalt. Well-developed foliation at 60CA is defined by fine laminations and Qz-Carb-filled fractures. Late fluorite in fractures cutting across foliation. Mineralized with 1-2% fine diss Py, traces Cpy. 187.85-188.10 m - strongly sheared basalt with foliation angles changing downhole from 60 to 50CA. Black, mottled with white Carb in fractures parallel to foliation; fine-grained, strongly magnetic. Mineralized with 2-3% Py and 0.25% Cpy (fracture-controlled). 188.45-188.50 m - 2-4 cm wide Carb-dominant vein with 5% massive Magn and 5-7% Py.</p> <p>From 188.10 m the rock becomes more or less consistent in appearance. Medium to dark greenish grey, fine-grained to almost aphanitic; in some parts contains 1-3% small white Plg laths. Mostly massive, locally pillowed and weakly amygdaloidal. Patchy magnetic due to the presence of Magn and Po. Intervals of in-situ breccia occur throughout the unit comprising about 5% and ranging from 5 to 35 cm in length, Angular fragments of basalt are cemented by white Carb (calcite). The unit is also cut by 1% Qz-Carb veinlets with rare Ep. Weak-mod bleached halos form around some fractures and veinlets. Mineralization: irregularly distributed Po and Py as blebs, diss grains, in some Qz-Carb veins, in bleached halos and pillow rims; concentrations range from traces to 2-5%. Traces Cpy. Calcite breccia veins are typically non-mineralized.</p> <p>191.05-191.75 m - 5-7% Py diss and fracture-controlled in fractured black basalt (?); 10% greyish Carb veins (2-4 cm wide) with fine diss Magn,</p> <p>200.75-201.00 m - greyish Carb-rich vein or highly altered basalt with bleached margins, foliated at 50CA, contains 3-5% fine diss Magn and 3-5% fine diss Py.
