# 1. Summary

SL Exploration Inc received a mandate in March 2020 from Kenorland Minerals Ltd to plan, conduct and supervise a geochemical survey on the Chebistuan Property; and to subsequently interpret and report results. The objective of the geochemical survey was to collect till samples in an attempt to define dispersal trains that could lead to mineralization.

## Property description

The Chebistuan Property is located north of Route 113 between Chapais and Waswanipi in the Jamésie region. Its center is about 45 km West of Chapais and it includes 3335 map-designated claims covering approximately 179 472 ha. The claims are in good standing and are 100% owned by Kenorland Minerals Ltd.

## Geochemical Survey

The property was systematically covered by a total of 4443 till samples, one kilogram each. These were taken by the use of a dutch auger within the B-Horizon of till material for multi element geochemical analysis (ICP-MS) at Bureau Veritas Laboratory. The samples were taken at every 150 - 200 metres along sampling lines spaced by 1.25 kilometres following an initial planification based on LIDAR and or satellite imagery.

## Results and Interpretation

Analysis of the fine fraction of till produces low gold value considering the vastness and prospectivity of the covered area. The maximum gold value is of only 143,1 ppb. Nevertheless, the results were interpreted in terms of 14 possible dispersal trains of either small size or large scattered signals elongated in the ice flow direction. Some of the other analyzed elements show local association with gold namely Ag, Cu, As and Mo.

## Conclusions and Recommendations

The Chebistuan Property, which represents a huge land package covered by 4443 till samples, delivers relatively low gold concentration. Despite their low priority rank, the 14 gold targets that were interpreted deserve local resampling with larger size sample (10-15 kg) to test the possibility of coarser gold signal that may have been overlooked by the fine fraction sampling.

# 2. Introduction

## 2.1 Objectives

SL Exploration Inc received a mandate in March 2020 from Kenorland Minerals Ltd (the "Company") to plan, conduct and supervise a geochemical (1 kg till) survey on the Chebistuan

Property; and to interpret and report the results. The objective of the geochemical survey was to collect till samples in an attempt to define dispersal trains that could be sourced to surface mineralization up ice from the anomalies. This report summarizes the sampling work performed and identifies geochemical anomalies in the till sample data. A comparison is then made between the till anomalies and known mineralized occurrences located up-ice from anomalies. Finally, this report proposes potential dispersal train for resampling anomalies and future work recommendations.

## 2.2 Source of Data and Information

This report is based primarily on data generated during the 2020 exploration program, in addition to all historical data available on the online databases (SIGÉOM and Examine) of the *Ministère de l'Énergie et des Ressources Naturelles du Québec* (MERN). The status and details of the claims discussed within this report were verified using the MERN's GESTIM system and database.

## 2.3 Involved Staff.

SL Exploration Inc. was in charge with the preparation, completion, interpretation and reporting of the geochemical exploration campaign on the Property. Inlandsis Consultants S.E.N.C. provided technical support regarding the planning of the survey and the sampling methodology. The role of each service provider is detailed in **Table 1**. The qualification of each professional is detailed in **Table 2**.

The planning of the campaign and supervision was conducted by Alex Gallardo Valade and Rémi Charbonneau. Field work also included the supervision of Pierre-Alexandre Pelletier. The geologists were accompanied by a team of technicians that changed between the different phases. The technicians included geology university students, geology CEGEP students and general workers. Alex Gallardo Valade and Pierre-Alexandre Pelletier were responsible for the preparation and shipments of the soil samples to the laboratory.

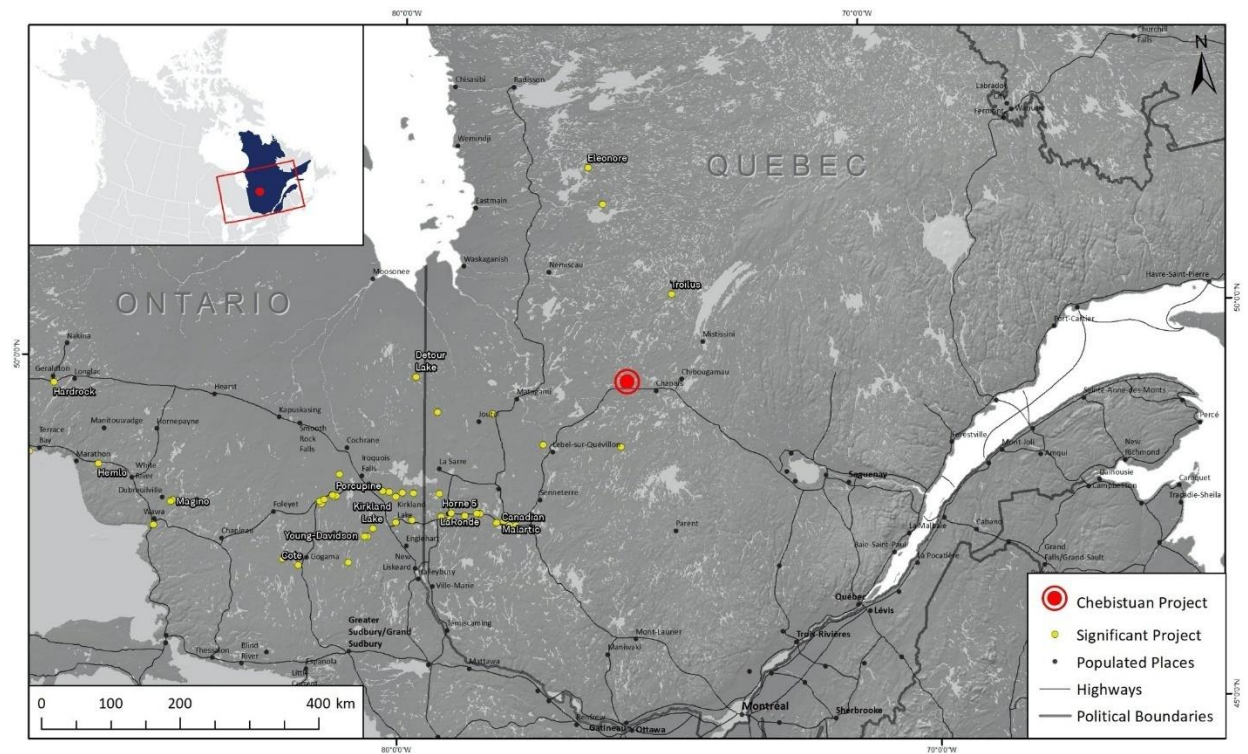

Sections 1 to 10 of the report was written by Gabriel Bigras and sections 11 to 14 by Alex Gallardo Valade (results, interpretations, conclusion and proposals).

A final check and inputs of the report was done by Rémi Charbonneau.

### 3. Property Description and Location

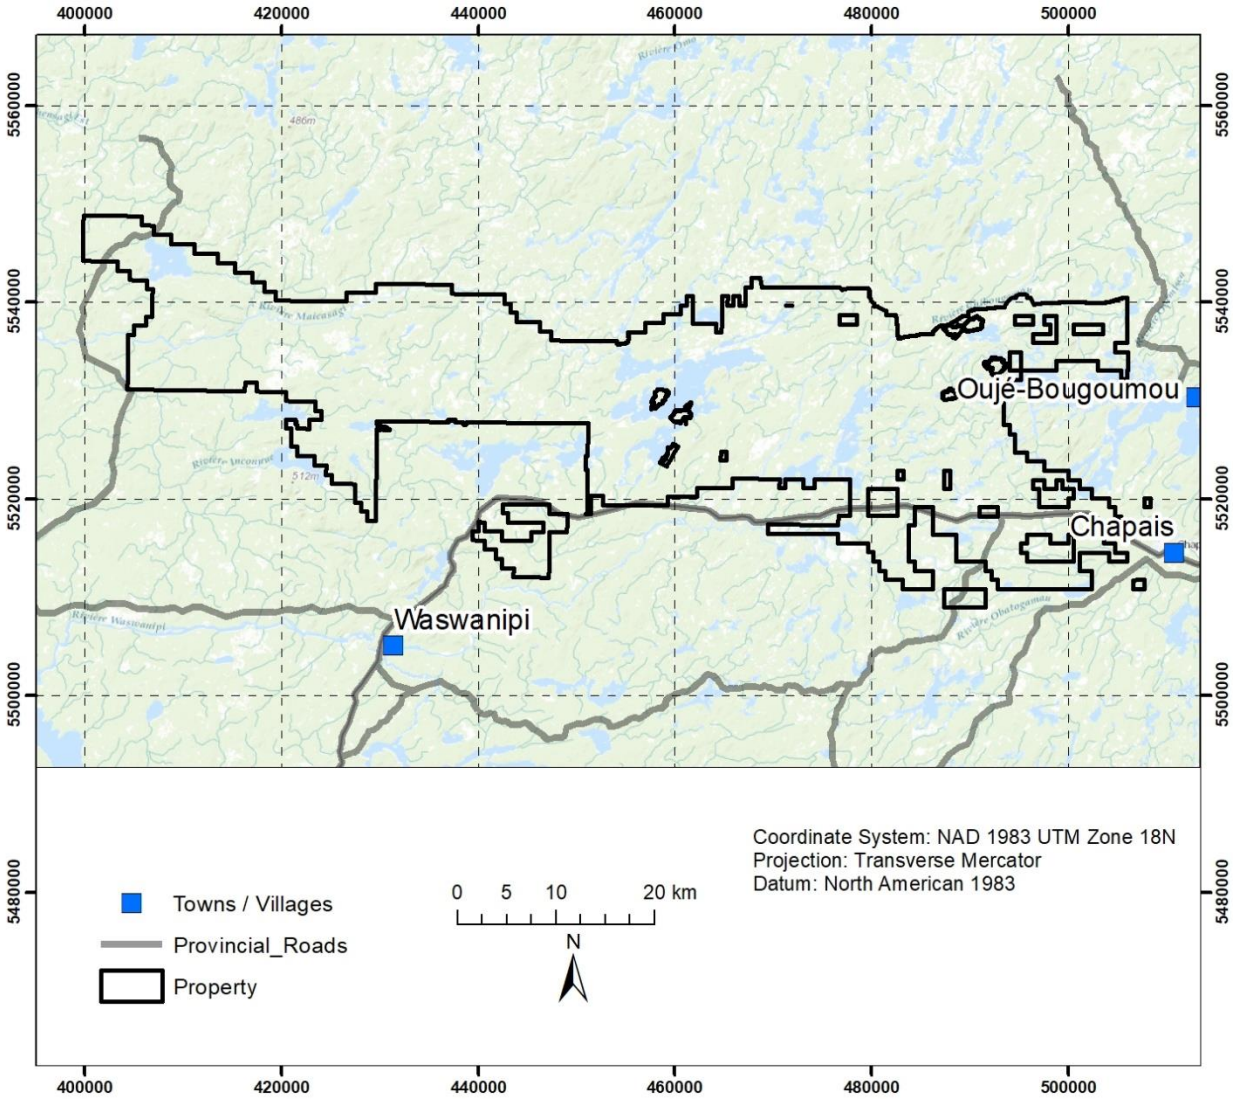

The Property spans a distance of 90 km west of the Chibougamau-Chapais area of Quebec. It is centered about 75 km W of Chibougamau and 45 Km W of Chapais (75°30' W 50°N or 466, 000 mE and 5, 529, 000 mN; UTM system, Zone 18N). The area is accessed by provincial highways 113 flanking the southern border of the property while direct access to the sampling lines is gained by an extensive network of logging roads. The Property straddles National Topography Sheets (NTS) 32F16, 32G13, 32G14 32G15, 32J04, 32J03, 32J02

Figure 1: Property Location

**Figure 2: Property Map**

### 3.1 Claims Status

At the time of writing, the Property consists of 3335 claims (CDC) covering approximately 179 472 ha or about 1795 km<sup>2</sup> (claim list located in Appendix I). The claims are in good standing and are 100% owned by Kenorland Minerals Ltd. It has to be noted that during the planning and sampling time period, the Property was smaller.

## 4. Topography and vegetation

The topography of the area is dominated by gentle hills and relatively flat terrain, with elevations ranging from 250 m above sea level to 600 m above sea level. The landscape includes many lobed

lakes, swamps and rivers. Approximately 70% of the claims are covered by forest and the rest of the Property is covered by swamps, lakes and streams.

Hilltops areas are generally covered by a thin veneer of undifferentiated glacial till. Adjacent valleys generally include considerable accumulated organic matter, more or less decomposed and derived from sphagnum, mosses, and forest litter. In the southeast of the Chibougamau river, lake sediments are dominant.

The Chibougamau River and lakes la Trêve, des Deux Orignaux and Kapunapotagen dominate the hydrographic system. Vegetation is typical of taïga with areas partially covered with black spruce and jack pine forests, with frequent wild fires.

## **5. Climate**

The Property climate is humid continental. It is characterized by warm summers, mainly in July, cold winters and abundant rain. Daily average temperatures range from +20°C in July to -25°C in January. Annual precipitation totals 684.5 mm of rain and 312.9 cm of snow. These are normal conditions for north-central Quebec and do not hamper either exploration or mining work.

## **6. Infrastructure**

There is no mining infrastructure on the Property. Services and equipment can be acquired from the town of Chibougamau, located approximately 50km to the East by paved road. Chibougamau is a forestry and mining town with a long history in resource development, where all the services, manpower and equipment needed to carry out exploration programs or operate a mine are readily available. The village of Chapais provides food, fuel, telecommunications, and medical services. The Chibougamau airport provides commercial air service from Montreal and is located within 40 km of the Property.

The nearby Cree Communities Oujé-Bougoumou, Mistissini and Waswanipi can supply Cree workforce that specialise in exploration work and can also provide manpower for a mine operation. The Chebistuan Property covers traplines W11, W11A, W12, W15A, W16, W21, W22, W23, W23B, O53, O54 of the Waswanipi and Ouje-Bougoumou Cree Nation.

## 7. Geology and Mineralization

The Property is located on the east portion of the Abitibi volcano-sedimentary belt. It is composed of two distinct groups, Roy and Opemisca. The Roy Group includes two volcanic cycles that consist of mafic lavas and co-magmatic sills evolving into tuff and felsic volcanics (Leblanc and Bouchard, 2005). Rocks underlying the Property are mostly composed of basalts and tuffs of the Blondeau Formation (Roy Group). To the North, felsic volcanics (dacites and rhyodacites) are observed. To the west, several sills were emplaced within the Roy Group. Gabbro, leucogabbro and quartz diorite of the Cummings Complex are locally interlayered with the Blondeau Formation, south of Lamark Lake and Heron Head Bay. Gabbro and thin pyroxenite bands of the Bourbeau sill are present. This sill hosts the Alouette copper nickel deposit in the southeastern part of the property.

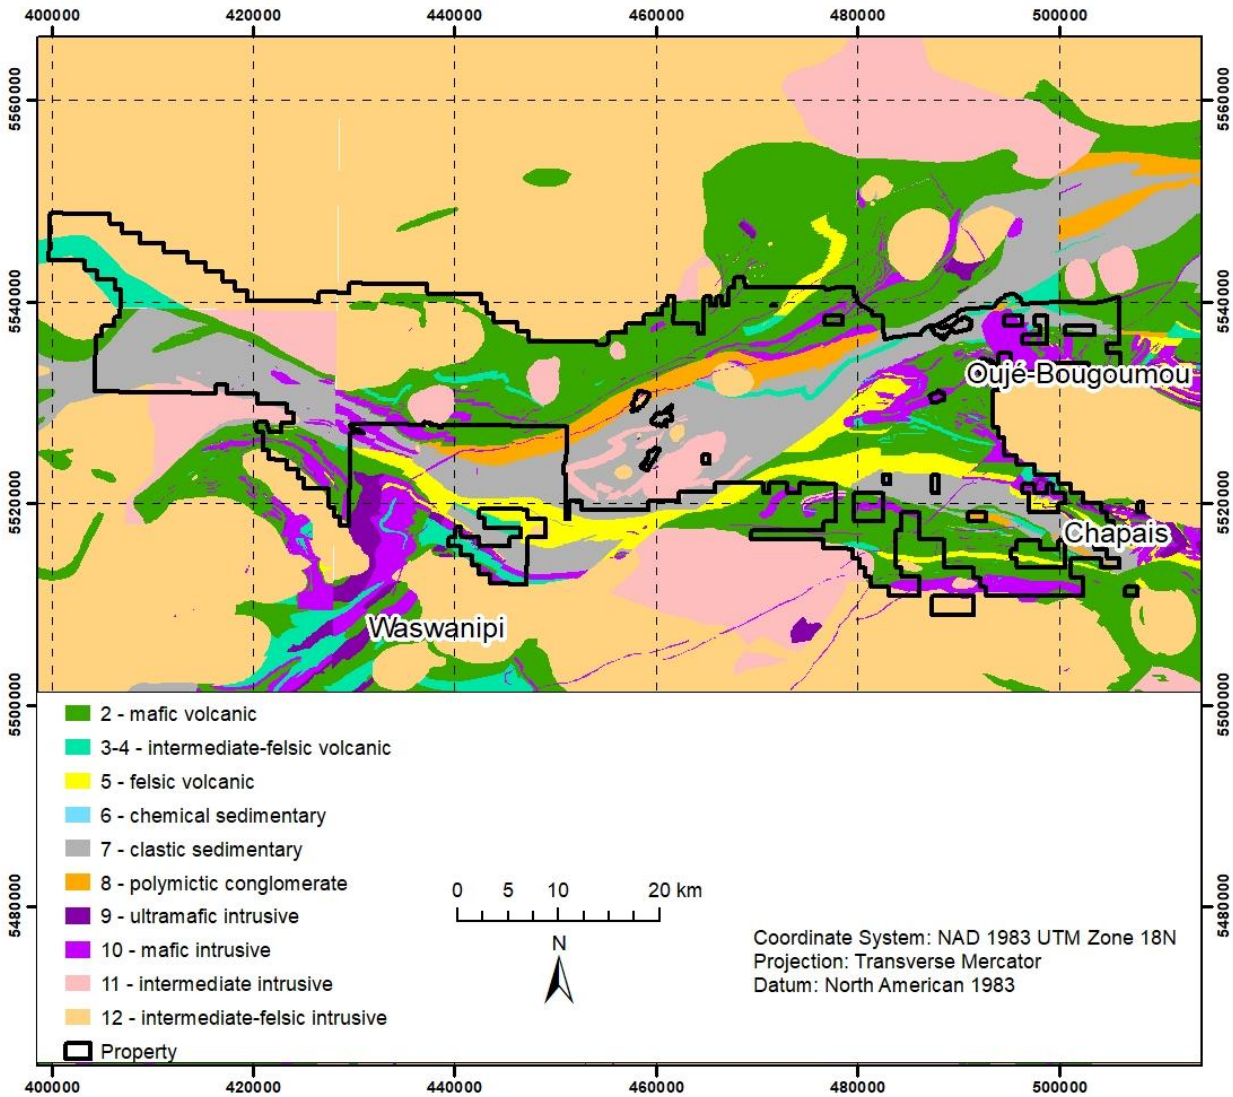

The Property hosts the sedimentary rocks of the Daubrée Formation (Opemisca Group), which is composed of sandstones, siltstones and clay-slate. In addition to the sedimentary rocks of Daubrée Formation, sandstones and conglomerates of La Trêve Formation (Opemisca Group) are also locally observed in the eastern portion of the Property.

Two regional faults are present. Lamarck Fault is a compressive southwest-northeast trending fault dipping steeply to the southeast. The Kapunapotagen Fault has an E-W trend and passes through the middle of Heron Head Bay and Kapunapotagen Lake. The Lamarck Fault seems genetically related to the Chapais Syncline (Charbonneau *et al.* 1988). It separates rocks of the Roy Groupe from those of Opémisca Group. These two faults meet just south of the Saussure Pluton, forming a similar geological context as Gwillim and Kapunapotagen Fault in the Chapais mining camp (Levy Township).

The region was intruded by several plutons, including the monzodioritic Houghton pluton which underlies the southern portion of the property. To the northwest, the Saussure intrusion (syenite) extends in a NE axis, parallel to the Lamark Fault and measures 10 x 4 km. A differentiated sill layer Rita (gabbro-pyroxenite to diorite) extends the Saussure intrusion over a distance of 5 km. These rocks are younger than those of the Roy Group. A contact metamorphism is observed on a width exceeding 100 m and produced hornfels rocks (or banded gneiss).

**Figure 3** shows the simplified lithologies occurring on the property.

**Figure 3: Simplified Lithology of the Property (SIGEOM, 2020)**

### 7.1 Glacial Geology

The Property shows well developed glacial landforms associated with the recent ice flow to the south-west ( $230^{\circ}$ - $240^{\circ}$ ) which is observable by the morphology on the areas (**Figure 4**). These consist mostly in De Geer moraines "They form a series of parallel segments 30 to 900 m apart, with an average distance of 190 m. This spacing was measured on the surficial deposits maps of Vincent (1985a and b). Their height varies from one to ten metres, however the moraines are often partially buried under more than a metre of marine clay. Vincent (1977) has observed that the moraine widths vary from 5 to 150 m and their length from 50 to 1500 m. According to Vincent (1977, p. 5 and 12), alignments of moraines many kilometres long would correspond to frontal positions of the retreating Nouveau-Québec Glacier. Another feature observed on the surficial

deposit maps of Vincent (1985a, b) is that the series of moraines is discontinuous. They form patches of moraines interrupted by areas of significant bedrock exposure. "Beaudry and Prichonnet (1995). Furthermore, drumlins, crag-and-tails and a few Rogens developed in the subglacial environment. The Property also hosts some esker systems associated with the recent ice flow. Moreover, an oldest ice flow to the South-east is observed by the striations on some outcrops throughout the Property, as stated by Beaudry and Prichonnet (1995)

"The direction of the oldest ice flow was toward the southeast. It was probably contemporary with the northwest ice flow direction identified by Veillette and Pomares (1991) west of Desmaraisville. These divergent ice flows could be related to the Mistassini Ice Divide of Dyke and Prest (1987). The southeast ice flow was followed by a southward ice flow and then by a southwest ice flow. This southwest ice flow was responsible for the development of most of the regional till sheet and the glacial landforms. Finally, a west-southwest ice movement took place."

## 7.2 Occurrences on the Property

The Property is host to multiple occurrences of mineralization which are summarized in table form (Table 3 to Table 36) and shown in Figure 5, Figure 6 and Figure 7.

## 8. Historic Exploration Work

### 8.1 Regional Geochemical Sampling

In 1985, the MERN conducted a soil sampling survey covering the whole 32 E/7 SNRC sheet and a part of 32 E/8 and 32 E/10. About 1 000 soil samples were taken on a fence of 1.5 x 1.5 km (MB 85-57). Three close samples containing between 55 and 3100 ppb Au and multiple samples next to each other with results between 18 and 55 ppb Au were found directly outside the south boundary of the eastern portion of the Chebistuan Property (**Figure 18**).

1986 Corporation Falconbridge Copper conducted a program of reverse circulation overburden drilling/heavy mineral geochemical sampling in the Chapais-Desmaraisville area of northern Quebec. 227 holes were drilled in La Ribourde, Saussure and Dolomieu Townships west of Chapais, Quebec (GM 44879). Heavy mineral concentrates were produced and returned values as high as 6700 ppb Au, of which three closely spaced continuous values higher than 5000 ppb Au and multiples values between 18 and 55 ppb were found in the same area, at the south-center boundary of the Property (**Figure 18**).

### 8.2 Historical Exploration

Very few exploration projects have been done compared to other sectors of the Abitibi greenstone belt. In total, 372 historical drillings were drilled, mostly targeting Cu-Au geophysical anomalies similar to those of the historic mining camp of Chibougamau-Chapais Au-Cu. Furthermore, the geochemical sampling done by the government in the 1980s did not have the adequate detections limits to target low Au level in glacial sediments and the sampling of stream sediments were

limited to the East part of the Property and the emphasis was on base metals, not on gold and other precious metals.

In 1948, J.E Gilbert publishes a report for the *Ministère des Mines du Québec* (MMQ) This mapping campaign covers the Branssat and Krieghoff areas. (Gilbert, 1972)

In 1951, the MMQ did reconnaissance geological work in the lake Capisisit sector following the discovery of gold and sulphides from Bachelor Lake. The work extends over most of the township of Montalembert and Davost, as well as a thin strip of Rouvilière and Monsignor. RG-048 (Gilbert, 1948)

In 1956, Malartic Gold Fields Ltd. performed geological and electromagnetic ground surveys covering a few small claim blocks on airborne electromagnetic anomalies in the township of Davost, Kreighoff and Branssat. No precise location information is documented. The anomalies are interpreted as graphitic sediments. (Eakins, 1957)

In 1957, Canadian Nickel Co. drilled one hole in the south-east part of the property. They intersected 0.67 m (2.2 ft) of massive sulfide (pyrite, magnetite) hosted in a pyrite disseminated tuff. No assays were reported. (Mcgregor And Thrall, 1957)

In 1957, Demers Chibougamau Mines drilled 4 holes near the center of the property, in the Obatogamau formation. Host rock appears to be andesite, with disseminated pyrite-pyrrhotite. Assay returned 0.05% Cu over 0.46 m (1.5 ft) from massive sulfides in hole No.1. In hole No.4, felsic rocks were observed, with disseminated pyrite-pyrrhotite-chalcopyrite, which assayed 0.05% Cu and 0.15% Zn over 0.85 m (2.8 ft). (Dallaire And Dumont, 1957)

In 1962, *Ministère des Ressources Naturelles* (MRN) published an airborne magnetic survey map 1: 250000 of sheet 32G. Map 7096G. (MRN, 1962)

Between 1969 and 1971, Union Minière Exploration and Mining Corporation Limited (UMEX) carried out a series of 52 holes in the canton of Davost and 2 holes in the canton of Monseignat (East part of the Chebistuan Property) by Géoméga Resources Inc. Prospecting is mainly focused on the conductors defined by electromagnetic surveys. They mainly described sedimentary rocks interbedded with pyroclastic. Some sections were graphite and sulphide rich. Sericite schist is also reported. Significant copper, zinc and lead indicators were reported, but silver and gold values were under detection limits. However, no analysis results are available for most drillings. (Coda, 1970)

From 1970 to 1972, Opemiska Copper Mines Ltd drilled 9 holes on south-east part the property, with 6 holes distributed along the Waconichi felsic tuff. One hole was drilled north of the band (W-25) and two holes (Y-9 and Y10) were drilled in the east portion of the property: several narrow graphitic bands hosted in tuff were slightly mineralized in hole W-13, with up to 0.10% Cu over

0.3 m (1ft) and 0.013% Zn and 0.014% Ni over 0.61 m (2 ft) (Gagnon, 1970). Hole W-25 contained a succession of mafic-felsic tuffs with some small mineralized intersections: disseminated sulfides returned up to 0.20% Cu over 0.61 m (2 ft), while a graphitic banded tuff returned 0.05 % Cu, 0.02 oz/t Au, 0.12 oz/t Ag, 0.01% Zn and 0.015 % Ni over 0.46 m (1.5 ft) (Lavoie and Leduc, 1971). In hole Y-10, a small gabbroic intrusion hosted in felsic tuffs returned 0.10% Cu and 0.022% Ni over 0.6 m (2 ft). (Gagnon et al., 1972).

In 1977, Drilling was done by the Patico Company. 5 holes were drilled with no significant results. (Limay and Murdy, 1977)

In 1978, Drilling was conducted by Shell Canada in the Lac Lamarck area. No significant values were found. (Castonguay, 1978)

In the 1980s, The MERN published the results of EM surveys carried out on several SNRC sheets: The Aerial surveys were done in the Chibougamau River area in 1981 and in the Goéland Lake area in 1984. (MERN, 1981 and 1984)

In 1985, 156 km of horizontal loop EM survey done by Exploreco Inc. on the Davost Property (west portion of the present Chebistuan Property) for FinNeth Exploration Inc. A south-eastern dipping syncline and four unexplained conductors are identified. (Rainsford, 1985)

In 1988, Minnova Inc. conducted a trenching and overburden heavy mineral geochemical sampling program of its Chapais West exploration project in Dolomieu Township approximately 35 km west of Chapais. Twelve trenches attained bedrock and produced two nugget anomalies. (Holmes and Averill, 1989)

In 1992, SAGAX Geophysics inc. performed geophysical surveys (magnetic and electromagnetic) for the Agnico-Eagle account on the west side of the Property. These surveys cover the entire Davost and Montalembert sheet. (Lachapelle and Potvin, 1992)

In 2011, G.L. Géoservice Inc conducted a geophysical prospecting campaign on the Grizzly property, Lac Dempster project, located 44 km northwest of the city of Chapais. A line section followed by a magnetic survey and an electromagnetic frame survey horizontal (EMI-I) were carried out. (St-Hilaire, 2013)

In 2012, Géoméga Resources Inc. conducted a basic geological mapping survey with 104 outcrops visited and 91 grab samples including 5 channel sampling on the west side of the Property. A Zn showing was discovered (0.15% Zn, sample 52753) in an iron formation which was followed up in 2 other channel samples (0.10% Zn over 0.3m in sample N121501 and 0.25% Zn over 0.3 m in sample N121502). A gold and silver showing (6.1 g/t Au and 31.2 g/t Ag, grab sample 52757) is also identified in pyritic mudstone containing up to 25% py. (Pelletier and Cayer, 2013)

In 2012, Géoméga Resources inc. performed a till sampling campaign of fourteen 15kg samples and a geological survey of the Lac La Trève area. This reconnaissance was accompanied by ground monitoring using a beep mat (BM4+). In total, 41 lithological descriptions were made and 36 samples were taken. The boulder sample TRE12-DF-003B (N125507) returned 1.71% Cu, 0.03% Ni, 4.96 g/t Ag and 0.21 g/t Au. A second sample was taken from the same boulder, TRE12-DF-003a (N125506) and gave values of 0.96% Cu and 2.36 g/t Ag. (Charbonneau, 2013)

In 2014, Prospectair Geosurveys Inc. performed on behalf of Resources Géoméga Inc. a 642 line-km airborne high resolution magnetometer survey. This survey covers 63 claims on the west part of the Property (GM 68800). Later that year, the company conducted another magnetic survey for the mining exploration company Fancamp Exploration Ltd. on its MTK Property located within NTS map sheet 032G14 in the Chibouragamau-Chapais area (center east of the Property). A total of 887 line-km were flown (GM 68133). (Dube, 2014)

In 2014, Géoméga Resources Inc. conducted a geological reconnaissance campaign. The work resulted in 43 rock samples and a till survey of 29 samples on the west of the Property. A value slightly anomalous was updated in a boulder (sample number R139008) with a gold content of 0.27 ppm. North of Lake McDonald, an anomalous value was also found in a till sample (till number: MD14-20) with a content of 539 ppb in the heavy mineral concentrate. (Pelletier and Cayer, 2014)

In 2014, Fancamp Exploration Ltd. mandated the firm Géosig Ing to conduct a geophysical survey on the MTK Property located on the center east of the Property. The IP survey covered a total of 63 km. (Tshimbalanga, 2014)

That same year, Nimsken Corporation Inc. mandated Géosig Ing to carried out ground Magnetometric (Mag) and HLEM-MaxMin surveys on the Cooper 32G-14 Project, for the Nimsken Corporation Inc. The geophysical campaign covered 7.4 kilometres of Magnetometric (Mag) and 17.1 kilometres of HLEM surveys. (Tshimbalanga, 2014)

In 2015, an outcrop and boulder sampling survey was conducted by G.L. Géosevice Inc. on the northeast of La Trève Lake, Grizzly/ Keller Project. Three samples returned values between 110 and 170 ppb Au. (Lamothe, 2015)

In 2016, an IP survey was conducted on 7,314.93 Ha NE of La Trève Lake by GFK Resources Inc., (GM 70669). Follow up by a trenching and channel campaign. 460 meters of outcrop were exposed by the trenching program and The NNESSW No-1 vein returned consistently high gold values along its full length with assay values reaching up to 18.0 g/t gold (GM 69904). (Boucher, 2016)

In 2017, Prospectair Geosurveys conducted a Heliborne High-resolution magnetic (MAG) survey mandated by SL Exploration for 1109692 BC Ltd. on the Pluto Property in the Chapais areas. A total of 448 line-km were flown. (Dube, 2017)

In 2017, SL Exploration Inc. was mandated by 1109692 B. C. Ltd. to conduct a till sampling survey on the Pluto Property in the Chapais area. It returned 77 tills, and three anomalous zones were delineated of which one was defined by a strongly anomalous gold signal (3120 ppb Au and 4.6 ppm Ag). (Robillard, 2017)

## **9. Exploration Sampling Surveys**

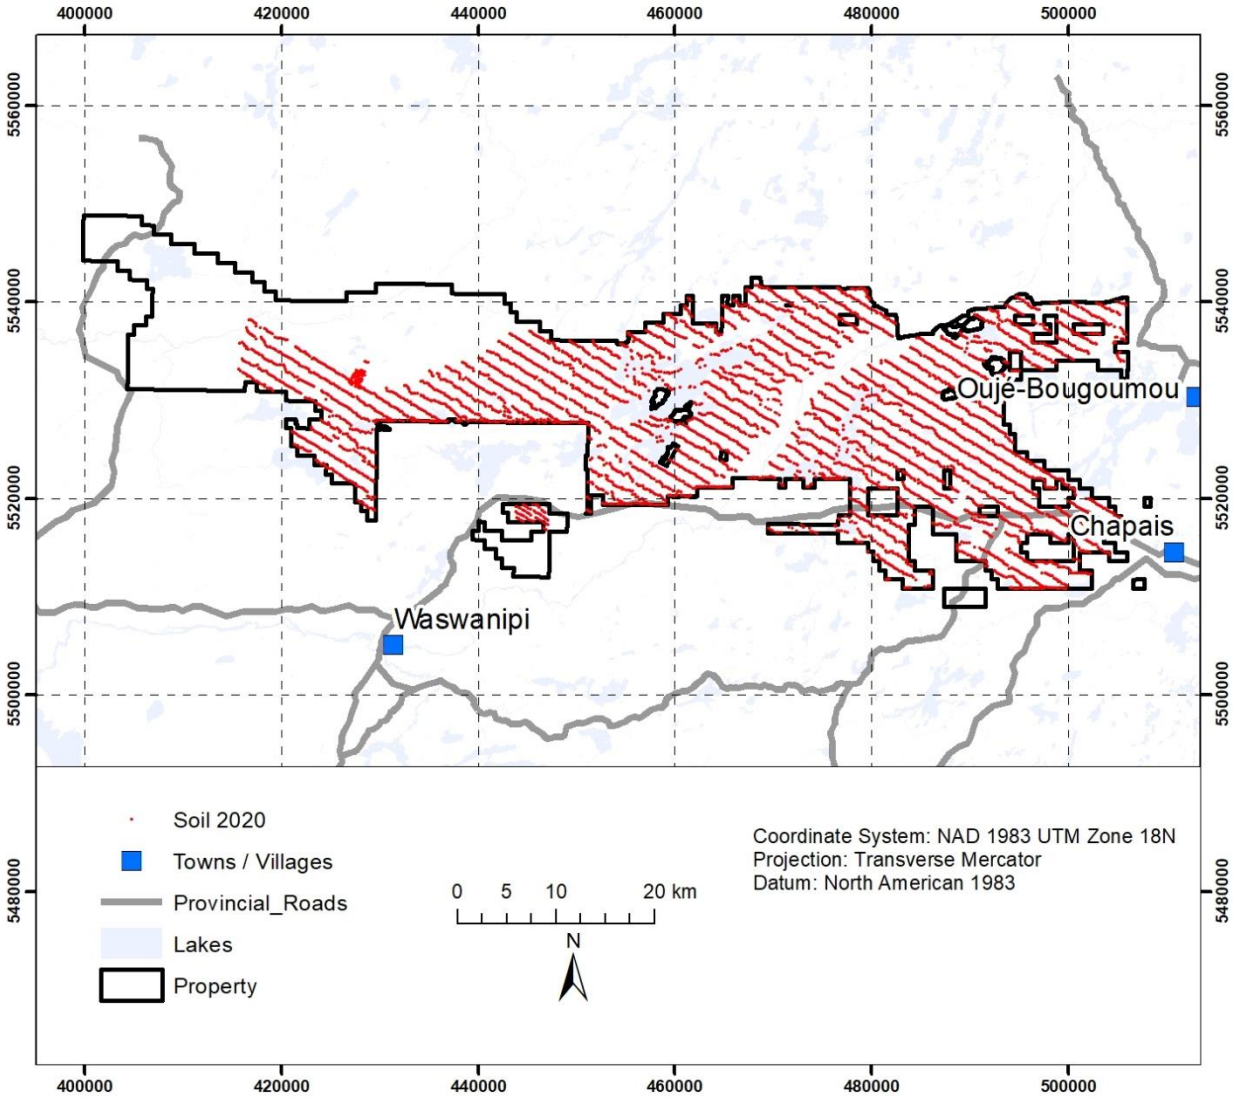

A large-scale geochemical survey was conducted on the Property from July 20<sup>th</sup>, 2020 to September 9<sup>th</sup>, 2020. The main sample type consisted of 1 kg of till material for geochemical analysis and returned 4381 samples. A follow-up survey was done on November 12<sup>th</sup>, 2020 on the northwest part of the Property and returned 62 additional till samples, for a total number of 4443 serviceable samples in 2020.

### **9.1 Exploration Principles**

As a part of reconnaissance exploration works, till sampling surveys aim to identify dispersal trains developed from hypothetical mineralization buried under superficial cover (Paulen and McMartin, 2009; McClenaghan and Layton-Matthews, 2017). Such dispersal trains consist of clastic fragments of minerals and rocks present in the glacial deposits (Klassen, 1997). In the present survey, analysis of the fine fraction and boulder samples is used to identify dispersal trains to be followed up-ice during subsequent sampling and traced to their source.

### **9.2 Glacial sediment sampling – 1kg**

The 2020 till survey covered the whole Property where surficial mapping and LIDAR data suggested the presence of till material. The campaign was conducted with a 200 m spacing along NW-SE oriented sampling lines spaced at 1250 m (**Figure 8**). A small follow-up sampling was done later in the northwest part of the Property in November with a tighter spacing of 100 m along NW-SE and 200 m between lines. Access was achieved by helicopter, boat and truck. The entire survey covered 3335 claims over an area of approximately 1795 km<sup>2</sup>, with a total of 4443 serviceable 1kg samples.

**Figure 8: 1 kg Soils Location on the Property**

The till samples were primarily collected in the B-horizon at depths of 30-200 cm using an auger. About 1kg of till matrix was placed in pre-numbered cotton bags. Some of the samples (n = 160) were taken from A-horizon and in some cases in the C-horizon (n = 100) when "B" was too thin. Locations were obtained from handheld Garmin GPS and Motorola Android mobile devices with the Fulcrum application. This data collection application was also used to register descriptions of the sample, local field conditions, coordinates and pictures of said samples and their respective environment.

## **10. Sample Preparation, Analysis, and Security**

For the 2020 program, samples collected in the field were described in detail before being sealed into synthetic fabric sample bags. GPS coordinates and a brief description were also recorded for each individual sample. Samples were placed into sample bags with a sample tag inserted into the bag and the corresponding number written in black permanent marker on the outside of the bag. All samples collected during the exploration program were stored in an enclosed garage at camp, inventoried and were later put in bigger rice bags for shipping on pallets to the laboratory.

### **10.1 Glacial sediment analytical – 1kg**

The 1kg till samples were shipped to Bureau Veritas Labs in Timmins (Ontario, Canada). They were prepared using protocol SS230 for complete drying at 60°C, sieve up 100g to -63µm (230 mesh) and the procedure SS10 was also applied for sediment particles up to 2mm (10 mesh). They were analysed using the AQ252-EXT multi-element protocol, where aliquot of 30g is analyzed by ICP-MS after partial digestion in aqua regia.

The series of analyte includes 53 elements as follow: Ag, Al, As, Au, B, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, Hg, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Pd, Pt, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn, Zr with very low detection limits.

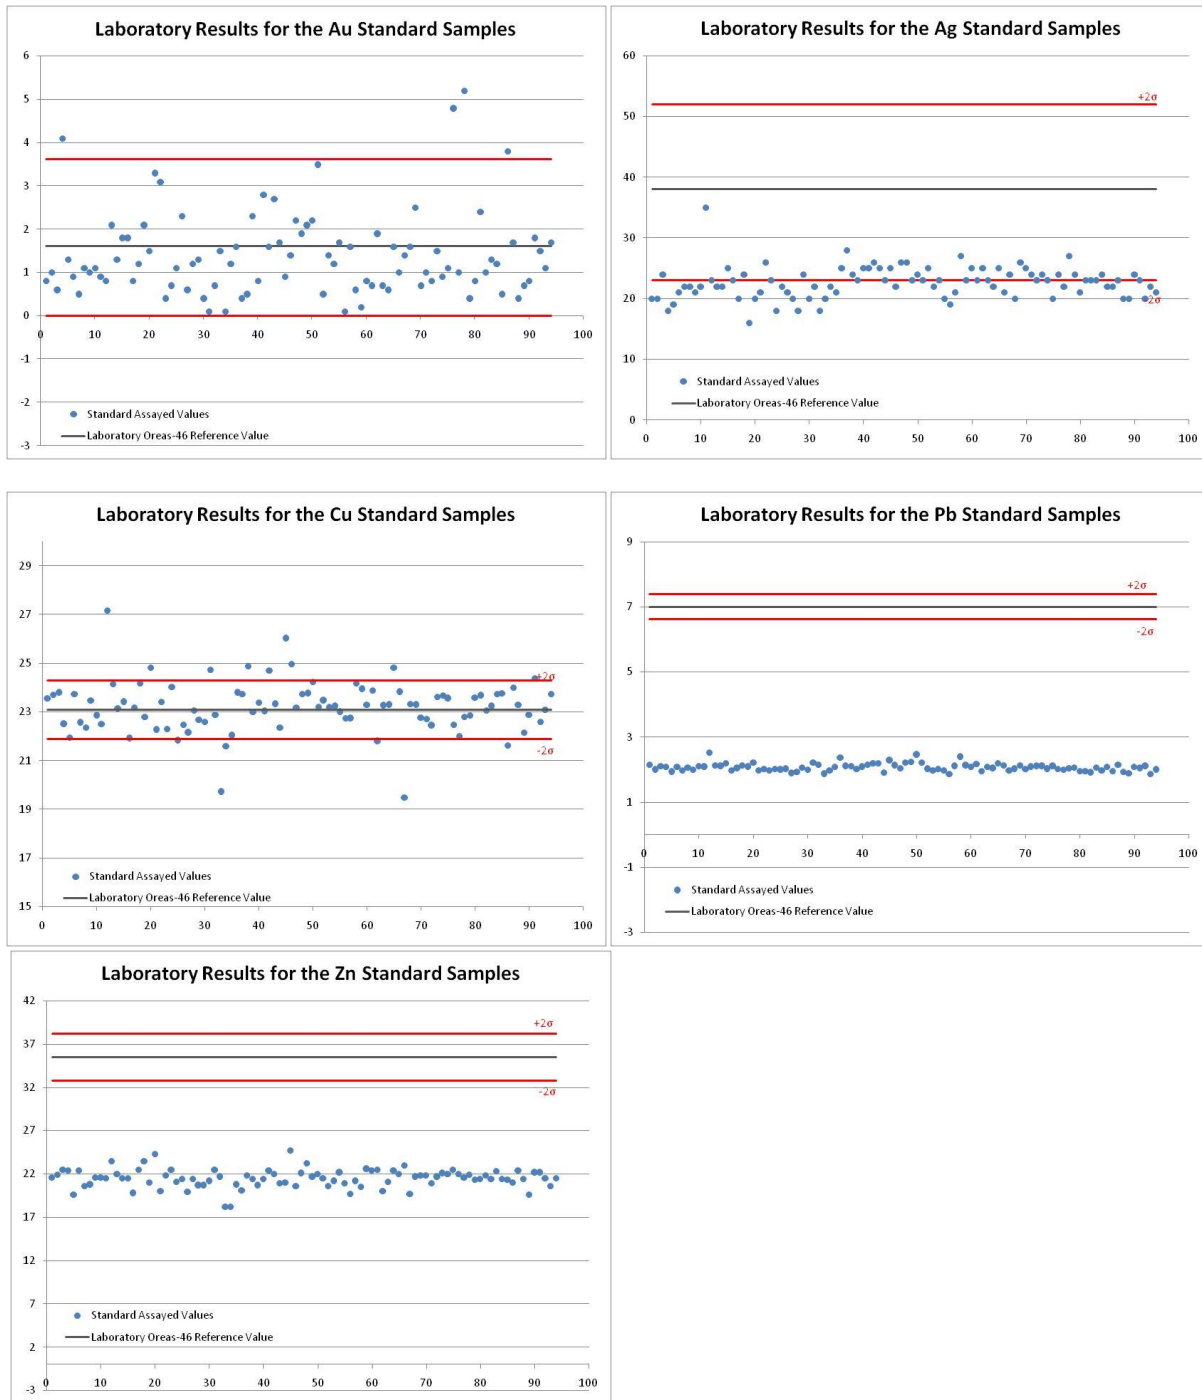

### **10.2 Quality Control**

For the purpose of quality control for soil samples, certified reference material (CRM Oreas-46) was introduced into the series sent to the laboratory.

Bureau Veritas Minerals Laboratories are accredited laboratories meeting international standards ISO 9001:2000; the Canadian Association for Laboratory Accreditation Inc. Standard ISO/IEC 17025-2005 (General Requirements for the Competence of Testing and Calibration Laboratories), and standard RG-MINERAL (SCC Requirements and Guidance for the Accreditation of Mineral Analysis Testing Laboratories).

A total of 94 CRM were inserted at a frequency of about one (1) every fifty (50) samples. Over the 4443 soil samples, representing 2.11% of the samples analyzed, which is below the industry standard for QA/QC. No duplicates were collected during the 2020 campaign and no blanks were inserted. In previous campaigns in the James Bay area, duplicates were found out to be of poor interest due to the variability of the till material. It was also deemed that a blank sample was not necessary at this stage since the provided CRM contains a very low quantity of gold, which would allow the detection of any contamination through the assaying process.

**Figure 9 : Oreas-46 Laboratory Results**

For the Oreas-46 Standard (**Figure 9**), the assayed values for gold are mostly within the two standard deviations reported from the certificate for the standard. Only 4 samples out of 94 fell above two sigma of the reference material. For silver, 50 samples fell between two sigma of the reference material and 44 samples fell below minus two sigma. For copper, 79 fell within between

two sigma of the reference material, 6 values fell below minus two sigma and 9 fell above plus two sigma. The lead (Pb) and zinc (Zn) results are systematically under-evaluated by the laboratory and falls below the minus two sigma.

## 11. Results

The survey resulted in 4443 samples (**Figure 8** and **Plan 1**), most of which are described as brown to orange diamict with a fine sand to silty matrix hosting more than 5 % angular to subangular clasts (**Figure 10** and **Figure 11** and **Appendix II**). Apart from the southeast zone of the Chibougamau river, where lakes are dominant, the Property has been properly covered by the present sampling campaign since most description and till fraction size points to a glacial origin. Analysis of the fine fraction returned significant gold signals, some of them well aligned in the ice flow direction (**Figure 13** to **Figure 16**).

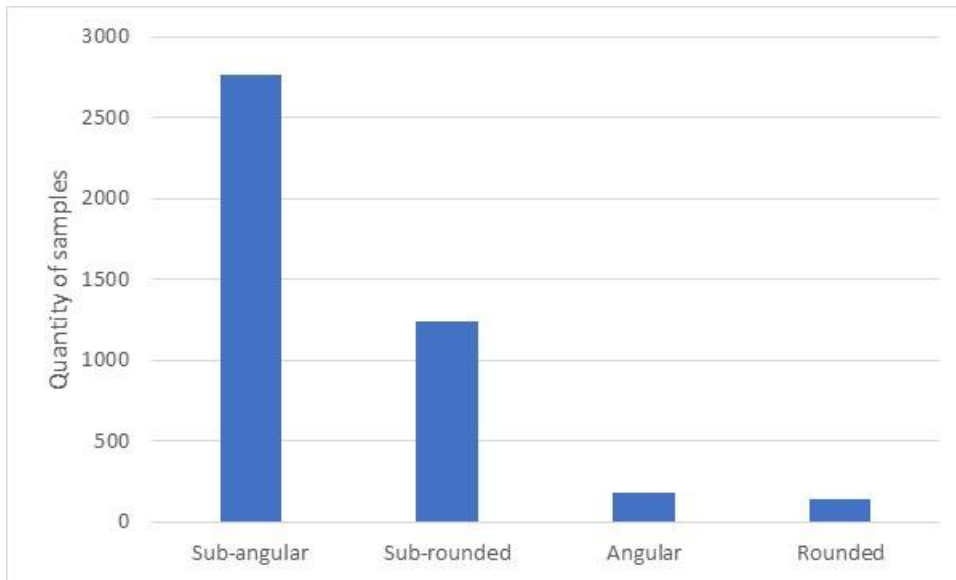

The vast majority the samples have less than 10 % of clast (**Figure 10**) mostly humid and subangular in shape (**Figure 11**). In some cases, samples were taken in sand or gravel when the diamicton was not available (**Figure 12**). As was the case for the south-west isolated portion near Waswanipi, which had to be quickly sampled to assess its potential since the claim was subject to local negotiations due to the construction of a waste treatment facility for Waswanipi.

The clast % was estimated by the samplers and the sediment type was obtained with the results of the laboratory using the size-fraction percentages of protocol SS230 and the protocol SS10.

### 11.1 Anomalous threshold determination

Till geochemical assays (certificates are in **Appendix III**) were processed in Microsoft Excel spreadsheets for the determination of basic statistics (**Table 37**). The anomalous threshold that is used here for fine fraction of tills are of 20 ppb for Au and the average plus three standard deviations for the other elements. This basic analysis was combined to a Tukey outlier analysis done in the ioGAS software which was then projected on probability plots (**Figure 17**). It allowed to determine the different classes, by color and size, for each element in the software ArcGIS which was used to produce the various maps.

## 12. Interpretations

The present till results returned narrow gold signals supported by pathfinder elements, despite small (1 kg) and widely spaced till samples (1250 x 200 m), which is offset by low detection limit for gold (0.2 ppb) and other elements. In comparison, the heavy mineral geochemical sampling (Burns et al, 1986) returned high values of gold with reverse circulation down to the C-horizon and the current survey found anomalous values in the same area (**Figure 18**).

**Figure 18: Historical till results from the 1986 RC drilling and 1985 MERN soil sampling, with current soil Au results**

Geochemical anomalies allowed the selection of interesting areas (orange and red contours in **Figure 19**) for precious and base metals mineralization in the underlying rock.

Anomalous thresholds were determined in an Excel spreadsheet conjointly with ioGAS software and plotted on map using ArcGIS for manual contouring. The anomalous values of interesting elements were contoured to indicate structural trend or glacial transport. Most elements had very low values and cannot be inferred as economic mineralization.

Contours with pathfinder elements likely represent local derivation within 100 m to 2 km. In total, 14 zones (yellow contours in **Figure 19** to **Figure 22**) were delineated and would deserve follow-up work with systematic high-density sampling coverage and detailed follow-up targeting

anomalous gold values. Among the anomalous contours, two trends of anomalous gold over 5 km are interpreted as dispersal trains. The up-ice portion of these narrow trains could be associated with gold mineralization and are thus classified as high priority targets.

On the western end of the Property (**Figure 19** and **Figure 20**), six zones returned geochemical trend for gold, all with multiple elements. The gold signals extend only over one to two sampling lines (1250 meters), except for Target 6 (three lines) which has no anomalous value in its middle. In this figure, the most interesting area is Target 1, which has three anomalous values over two sampling lines along the ice flow and is associated to pathfinder elements: Ba, Bi, Co, K, Mo and Zn. Target 2 has two high Au values and was the subject of an infill follow-up in October 2020. The assays did not return anomalous values in gold however.

On the East portion (**Figure 21** and

**Figure 22**), eight gold trends were identified, including three with multiple elements. In general, they extend over more sampling lines compared to the west side. Most interesting are Target 7 and 9. Number seven spans over 7 kilometers along ice flow direction with anomalous Au values wide at the front of the dispersal trend (up-ice) and narrow-lower values at the tail (down-ice). It is associated with pathfinders As, Co, Cu, Mo, S, Th and Zn. Target 9 is similar but narrower and over 5 kilometers with weaker signal of pathfinder elements: As, Sb, Ta, Te and S.

All the targets are summarized in **Table 38**.

**Table 38: Targets of anomalous Au on the Property**

Target	Priority	Notes
1	3	3 anomalous signals over 2 lines in ice trend; possible dispersal train
2	1	2 contiguous anomalous signals
3	1	2 contiguous anomalous signals
4	1	Small-size and low-value anomaly. B and Ta at the dispersal head
5	2	Dispersal train or structure. Te, V and Ti at dispersal head; Cu, Co, Sb, S, Te at tail in odd shape
6	1	2 anomalous signals, not in ice-trend
7	4	7-km dispersal train; 2 anomalous signals with Au at the front's train and As-Cu in the middle
8	3	Thin dispersal train with only Au at front, As-Sb at the tail; poor sample coverage
9	4	Dispersal train with Ta-Te at the front; As-Sb-Te-S in odd shape at the tail
10	3	Dispersal train or structure; Zn at the front and Sb-Ti-V at tail
11	2	Scatter fan, associated with ultramafic signature source at the NE
12	3	3-km possible dispersal train with only Au and some Ag at the front
13	2	Possible very narrow dispersal train
14	0	Highest Au value without associated elements

## **13. Conclusions**

Till sampling (1kg) at every 200 m along transects planned perpendicularly to main ice flow at every 1250 m resulted in 4443 serviceable analysis.

Samples were dried and sieved at 63 $\mu$  before aqua regia partial digestion of till fines (30g) for ICP-MS analysis with very low detection limits (e.g. 0.2 ppb for Au).

Sample description and fraction size analysis indicate a glacial origin for the vast majority of samples. The Chebistuan Property is properly covered except to the southeast of the Chibougamau river where lake sediments were dominant.

The results present approximately 50 significant gold signals of more than 18 ppb which are supported with other pathfinder metals including Sb-Cu-Ag-Te-W and some PGE.

Precious and base metal values were statistically treated to identify anomalous values and were plotted on maps. Anomalous contours were hand-draw to identify distribution patterns. The majority of resulting signals are scattered through the Property but can be considered as clustering around the (1) McDonald Lake, (2) Chibougamau river and (3) Landing Lake.

## **14. Recommendations**

The targets identified deserve additional work through larger till samples to detect and analyze gold grain at the head portion of the anomalous sector and confirm the presence of significant gold dispersal train. These representative sample should be taken in the C-horizon whenever possible, to obtain better preserved glacial material.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.  
\*\*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
