## Certificate of Qualification (Alain-Jean Beauregard)

I, Alain Jean Beauregard, P. Geo., do hereby certify that:

1. I am a geologist and the President of:
   Geologica Groupe-Conseil Inc.
   450, 3rd Avenue, Suite 202,
   P.O. Box 1891, Val-d'Or (Québec), J9P 6C5

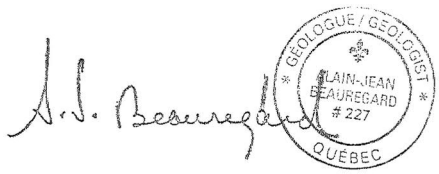
2. I am a qualified geologist, having received my academic training at Concordia University, in Montreal, Québec (B.Sc. Geology and Mining – 1978) with a certificate in Business Administration (Val d'Or – 1988).

3. This certificate applies to the Technical Report entitled "2017-2019 Fieldwork Report on the Lamaque Property over Mining Claims" ("the Technical Report"). This report was written for Eldorado Gold Québec Inc. and dated December 7, 2020.

4. I am a member of the Order of Geologists of Québec #227 (OGQ), also of the Québec Mining Exploration Association (AEMQ), of the Canadian Institute of Mining and Metallurgy (CIMM) and the Prospectors and Developers Association of Canada (PDAC).

5. I have worked as a geologist for a total of 42 years since my graduation from University with the production of more than one thousand eight hundred (>1800) technical and financial reports in English or French for government authorities, private and public companies including numerous market value assessments of mining properties from grassroots projects to developed mines, and several companies' entire portfolio of properties. Organization and management of many exploration campaigns for gold, base metals and industrial metals, especially in remote areas of Abitibi, but also in other parts of Québec (Labrador Trough, Gaspé Peninsula, James Bay, St-Lawrence River, North Shore, Ungava, etc.), in eastern Canada, Europe, Africa and the Americas.

6. I have read the definition of "qualified person" set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements to be a "qualified person" for the purposes of NI 43-101.



7. I am responsible for the technical parts of all Items of the Technical Report. I have not recently visited the subject property. However, I have currently worked and supervised the drilling programs on this property between 2009 and December 2015.

8. I am not aware of any material fact or material change with respect to the subject matter of the Technical Report that is not reflected in the Technical Report, the omission to disclose which makes the Technical Report misleading.

9. I had prior involvement with the property that is the subject of the Technical Report.

10. I am independent of the issuer (Eldorado Gold Québec Inc.) applying all of the tests in section 1.5 of National Instrument 43-101.

Dated this 7th day of December 2020

Alain-Jean Beauregard, P. Geo., OGQ (#227)

## Certificate of Qualification (Daniel Gaudreault)

I, Daniel Gaudreault, Eng., do hereby certify that:

1. I am currently employed as a geological engineer by:
   Geologica Groupe-Conseil Inc.
   450, 3rd Avenue, Suite 202,
   P.O. Box 1891, Val-d'Or (Québec), J9P 6C5

2. I graduated with a degree in Geological Engineering ("B.Eng.") from the University of Québec in Chicoutimi in 1983.

3. This certificate applies to the Technical Report entitled "2017-2019 Fieldwork Report on the Lamaque Property over Mining Claims" ("the Technical Report"). This report was written for Eldorado Gold Québec Inc. and dated December 7, 2020.

4. I am a member of the "Ordre des ingénieurs du Québec #39834 (OIQ)", of the Québec Mining Exploration Association (AEMQ) and the Prospectors and Developers Association of Canada (PDAC).

5. I have worked as a geologist for a total of 37 years since my graduation from university. An engineer specialized in geology and mining, I have been involved with all aspects of planning, organization and supervision of mineral exploration projects especially in remote areas of Abitibi, Québec. I have been in charge of teams of professionals and technicians on geological projects in the most severe conditions. I have also completed several geoscientific compilations and technical reports on areas of interest in Québec, Ontario, USA (California & Nevada) and South America (mainly Peru).

6. I have read the definition of "qualified person" set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements to be a "qualified person" for the purposes of NI 43-101.

7. I am responsible for the technical parts of all Items of the Technical Work Report. I have recently visited the subject property and I have currently worked on this property between 2009 and December 2019.

8. I am not aware of any material fact or material change with respect to the subject matter of the Technical Report that is not reflected in the Technical Report, the omission to disclose which makes the Technical Report misleading.

9. I had prior involvement with properties that are the subject of the Technical Report.

10. I am independent of the issuer (Eldorado Gold Québec Inc.) applying all of the tests in section 1.5 of National Instrument 43-101.

Dated this 7th day of December 2020

## 1.0 SUMMARY

At the request of Eldorado Gold Québec Inc. (“Eldorado”), Géologica Groupe-Conseil Inc. (“Geologica”) was given the mandate to complete a 2017-2019 Fieldwork Report on the Lamaque Property (“Property”) over the Mining Claims.

Alain-Jean Beauregard and Daniel Gaudreault are Qualified Persons under National Instrument 43-101. Mr. Beauregard and Gaudreault have visited the property on several occasions between 2009 and 2020.

### Location & History

The Lamaque Property is located in the Val-d’Or gold camp in Northwestern Quebec, approximately 550 km NNW of Montréal, Quebec and consists of one (1) Mining Lease, ten (10) Mining Concessions and sixty (60) mining claims for a total of 3,158.02 hectares, 100% owned by Integra Gold Corp. (Table 2). None of the claims are within park, forest reserves or other areas that are restricted from exploration and mining.

The Property boundaries now includes the area of the former Lamaque Gold Mines Limited belonging to the time to Teck Hughes Gold Mines Ltd., later became Teck Corporation, which produced between 1935 and 1985 a total of 4,554,167 ounces of gold; and the past producer Sigma Mine and Pit which have produced more than 4.7 million ounces of gold (published June 23, 2009) from 1935 to the present, and has approximately 5,000,000 gold ounces in resources and reserves.

To the west, the active Goldex Mine owned by Agnico-Eagle reported 3,500,000 gold ounces in resources and reserves. Agnico-Yamana Canadian Malartic open pit gold mine reported 10.71 million proven and probable gold ounces. The Val d’Or, Cadillac and Malartic mining camps have produced over 45 million ounces of gold since the 1930s and presently.

### Geology

The Property is principally underlain by steeply dipping east-west striking volcanic flows intruded by a variety of intermediate to mafic plugs, dykes and sills. The mineralized zones are ‘Vein-Type’ mesothermal structurally controlled deposits, which are typical of the Abitibi Greenstone Belt and abundant in other Archean greenstone belts around the world.

The gold bearing quartz-tourmaline veins are geologically younger and cut all rock-types, including irregular intrusive (diorite) bodies, which are affected by regional deformation and greenschist grade metamorphism. Two main types of veins occur at the nearby Lamaque Mine: subvertical and subhorizontal veins. The subvertical veins

occur within steeply dipping east-west trending ductile shear zones along which reverse sub-vertical displacements have taken place. The veins occupy openings created by irregularities during progressive movement within the shears. Subhorizontal veins occupy extensional fractures, which are formed between ductile shear zones, preferentially in the more competent host rocks. According to Neumayr et al. (2000) the mineralized zones and deposits at Lamaque are second and third-order structures related to deformation along the Larder Lake – Cadillac Fault Zone.

## Exploration and Drilling

One hundred eighty eight (188) diamond drill holes were completed in 2017-2019 on the Exploration Program on the Property over the mining claims in order to validate and follow-up in the lateral and depth extensions of mineralized zones intersected. A total of 77,366.86 meters were drilled.

Mainly lapilli and blocky tuffs were intersected. They often alternate with coarse grained diorite (Triangle Type). Generally chloritized and carbonatized rocks are sheared and fractured and some shear zones are intersected. Several mineralized veins were injected; the vein thicknesses vary between 0.5 cm and 40 cm with trace-1% of pyrite, locally 10% and very locally trace-7% of chalcopyrite. They are mostly composed of quartz-carbonate-tourmaline and/or chlorite-sericite-feldspar; but rarely epidote and calcite.

## Resource Estimate

Table herebelow shows mineral reserves and resources on the Property (extract from the website of the company, September 30, 2019):

| Mineral Reserves and Resources | Metric Tonnes | Au (Grams per Tonne) | Ounces of Gold |
|---|---|---|---|
| Proven and Probable Reserves | 4,091,000 | 7.39 | 972,000 |
| Measured and Indicated Resources | 5,763,000 | 8.34 | 1,545,000 |
| Inferred Resources | 8,998,000 | 7.01 | 2,028,000 |

## Recommended Exploration

Geologica considers that the fundamental controls of the mineralization on the Lamaque Property are structural, and recommends that a structural interpretation to define potentially mineralized shear and fault structures (both cross cutting and parallel to stratigraphy) be continued and refined. A comprehensive digital database which is already ongoing needs to be continuously followed and compiled. Compilation of all drillholes information, including surface exploration surveys, geology, assay results and all technical surveys will continue.

Geologica believes more exploration and definition drilling is warranted to better define and test for lateral and at depth extensions of the known zones and to explore

for other mineralized zones in the hosting structures. Complementary exploration work including compilation and interpretation of past drill holes, and complementary drilling on Southwest Area is recommended to evaluate the depth and lateral extensions.

## 2.0 INTRODUCTION AND TERMS OF REFERENCE

At the request of Eldorado Gold Québec Inc. (“Eldorado”), Géologica Groupe-Conseil Inc. (“Geologica”) was given the mandate to complete a 2019 Fieldwork Report on the Lamaque Property (“Property”) over the Mining Claims.

Alain-Jean Beauregard and Daniel Gaudreault are Qualified Persons under National Instrument 43-101. Alain-Jean Beauregard and Daniel Gaudreault have visited the property many times between autumn 2009 and December 2019, and supervised all the exploration work completed on the subject property from 2009 until December 2017.

All currency amounts are stated in Canadian dollars. Quantities are stated in both imperial and/or SI units, the Canadian and international practice, including metric tonnes (tonnes, t) and kilograms (kg) for weight, kilometres (km) or metres (m) for distance, hectares (ha) for area, grams (g) and grams per metric tonne (g/t) for gold grades; and grams per metric tonne (g/t) for silver, platinum and palladium grades; percentage (%) for Nickel and Copper grades. Precious metals quantities may also be reported in Troy ounces (ounces), a common practice in the gold mining industry.

## 3.0 PROPERTY DESCRIPTION AND LOCATION

### 4.1 LOCATION AND CLAIMS

The Property is located in the Val-d’Or gold camp in northwestern Quebec, Bourlamaque Township, partly within the municipality of Val d’Or, about 550 km northwest of the City of Montréal, Province of Quebec (Figure 1 and Figure 2). The area is centered at 48°05’N Latitude and 77°46’W Longitude on the National Topographic Map reference 32C/04 (Quadrangle sheet).

The Property consists of one (1) Mining Lease, ten (10) Mining Concessions and sixty (60) mining claims totalling 3,158.02 hectares which are 100% owned by Eldorado Gold via Integra Gold Corp. and Or Integra (Québec) Inc. (Figure 3 and Table 1. None of the claims, concessions and mining lease is within park or forest reserves that are restricted from exploration and mining.

The status of the concessions, mining lease and claims was validated using GESTIM, the government system for management of claims, available on the Quebec Natural Resources website: https://gestim.mines.gouv.qc.ca.

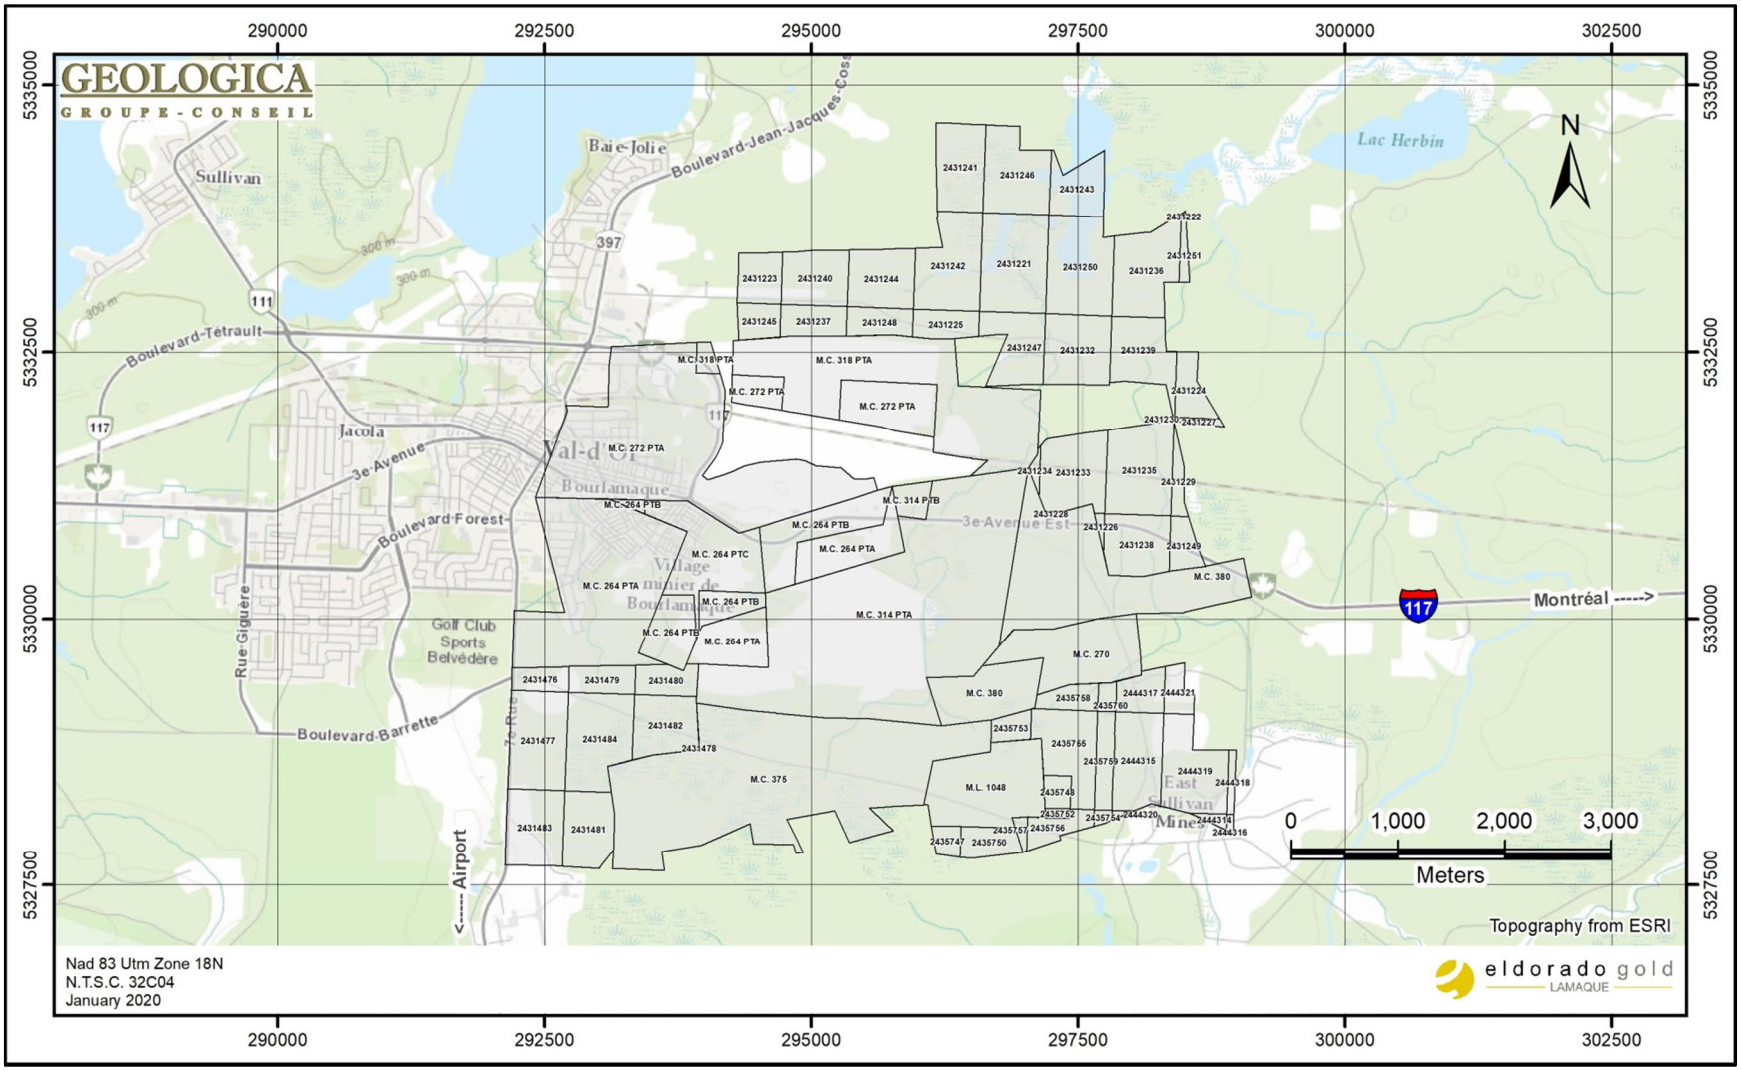

Figure 3 - Lamaque Property Mining Titles Map

### 4.2 ENVIRONMENTAL OBLIGATION

Part of the Lamaque Property is covered by tailings of the past mining operations at the former Lamaque Mine (1935-1985) (historical site now named Cité de l'Or) (Figure 2). These tailings are largely confined by a tailings dam. They are stable, fairly dry and support grasses and herbaceous growth. Previous and newest holders planted conifers on various parts of the tailings and these trees appear to be doing well. The tailings do not appear to have the potential to generate acid mine drainage.

Some parts of the tailings, depending on season and weather, are wet, permit standing water and support creeks. Excess water exits the tailings area by runoff over a spillway.

Eldorado must respect all laws and regulations and comply with municipal, provincial and national bylaws prior to conduct exploration works (drilling, wood cutting, access etc.) and as to get all the appropriate permits from competent authorities such as the Quebec Ministries of Environment and Natural Resources.

## 5.0 ACCESSIBILITY, LOCAL RESOURCES, INFRASTRUCTURE AND PHYSIOGRAPHY

The town of Val-d'Or is located on highway 117, east of the town of Malartic and the city of Rouyn-Noranda. Highway 117 runs through the property in its centre and provides easy access to the entire property. The Property is adjacent to the eastern limits of the city and is accessible via public and bush roads suitable by trucks and all-terrain vehicles (ATV). The Val-d'Or airport, which has regularly scheduled flights to Montreal, is located on the southwest edge of the Property.

Val-d'Or, with a population of approximately 32,000 persons, is a modern city and one of the largest communities in the Abitibi region with a long and rich mining heritage. Supplies, manpower and service providers are readily available and local resources include construction contractors, drilling companies, exploration service companies, engineering and various other consultants and equipment vendors. The power lines and telecommunication systems can also be easily accessible.

A large swamp partially covers the Property, while spruce forest and mixed deciduous and coniferous forest cover the eastern, western and southern extremities. The relief rarely exceeds 50 m, except where eskers and glacial deposits are found. The Property is at an elevation of about 320 m above sea level.

The Lamaque tailings retention area covers part of the south central part of the Property. As described under Environmental Issues, this tailings area was populated with herbaceous growth, grasses and areas of small trees planted by Eldorado's

previous holders. Spruce forest and mixed deciduous and coniferous forest cover much of the rest of the Property.

Based on Environment Canada statistics, from 1971 to 2000, the region was characterized by a mean daily temperature of 12° Celsius. The month of July has an average temperature of 17.2° Celsius, whereas the month of January averages – 17.2° Celsius. The extreme minimum recorded temperature was -43.9° Celsius, whereas the highest recorded temperature was 36.1° Celsius. There were 209 days recorded below freezing point and the average annual precipitation is 954 mm. The month of September receives the highest precipitation average with 101.5 mm of rain. However, July is the month with the highest daily amount of precipitation with 68 mm of rain. Snow falls from October to May with the highest amounts between November and March. The monthly average precipitation for this six month period is 54 mm.

## 6.0 HISTORY

*The production, resource and reserve estimates, indicated below on this Item, are of a historical nature and do not comply with NI 43-101. However, the authors believe that this information gives a conceptual indication of the potential of the area and that it is pertinent to this report. The qualified persons have been unable to verify the information and the information is not necessarily indicative of the mineralization on the property that is the subject of the technical report.*

### 6.1 BEFORE 2003

The early history of the Lamaque Mine was described by Wilson in 1948. He describes the original gold discovery by R. Clark in 1923 and subsequent staking of the original claims the same year followed by prospecting, stripping and trenching.

In 1928, Read-Authier Mines Limited was formed to acquire the Lamaque property. One year later, 19 surface diamond drill holes totalling 2,143.05 m (7,031 feet) were drilled.

In 1932, Teck-Hughes acquired an option on the property and performed five small holes totalling 519.68 m (1,705 feet) in order to confirm previous results. The drilling program returned significant results and Teck-Hughes exercised its option, forming Lamaque Gold Mines Limited, a wholly owned subsidiary of Teck-Hughes to take over the original property and number of the adjoining claims.

Wilson reports that a shaft was sunk starting in January 1933 and lateral work followed as well as construction on the original mill in summer 1934. The mill started operations at 250 tons per day in April 1935; was increased to 500 tons per day by the end of 1935 and to 1,000 tons per day by December 1937.

Subsequently, other shafts were sunk in the area of the Main Mine (or No. 1 Mine). These shafts include the number 2, 3, 4, 5, 6 and 7 shafts (Figure 4).

The No. 2 Mine, located approximately 1,100 m northeast of the Main Mine area (not to be confused with the No. 2 Shaft located ≈ 600 m south), near to and on the extension of Sigma Mine structures, was developed in 1950-1951 to a depth of 410.56 m (1,347 feet) with nine levels developed. Production from the No. 2 Mine ceased on November 30, 1955.

In 1955 a new mineralized zone was discovered 1,370. m (4,500 feet) southeast of the Main Mine. Later, in early 1960's a three compartment vertical shaft named No. 3 Mine was sunk up to a depth of 480 foot (146 m) followed by development works on three different zones. The No. 3 Mine shaft is located below the former Lamaque tailings. Historical records indicate resources of 152,015 tons grading 0.220 oz Au/ton.

Subsequent drifts were extended towards the No. 4 Plug from the No. 3 Mine area to provide access on the 450-foot (137.16 m) and 700-foot (213.36 m) levels. The No. 4 Plug was mined and yielded 160,000 tons grading 0.152 oz Au/ton from workings above the 700-foot level. Production for the No. 3 Mine and No. 4 Plug areas extended from July 1961 to 1967. On the 300-foot (91.44 m) level the No. 3 Mine is connected with the No. 5 Plug workings.

In May 1985, all production at the Lamaque Mine ceased. The Lamaque mill was kept on a stand-by basis until 1986 for custom milling. Total production from the historical Lamaque Mine from 1935 to 1985 totalled 4,554,167 ounces of gold distributed over nine mineralized zones (see Table 2 herebelow and Figure 4).

Table 2 - Historical Summary Production on Lamaque Property

| Zone | Tons Milled | Grade Au oz/ton | Total ounces | % of Total |
|---|---|---|---|---|
| Main Plug | 20,025,627 | 0.185 | 3,695,194 | 81.14 |
| East Plug | 2,999,842 | 0.115 | 343,827 | 7.55 |
| West Plug | 1,644,606 | 0.133 | 219,014 | 4.81 |
| No. 4 Plug | 160,973 | 0.152 | 24,497 | 0.54 |
| No. 5 Plug | 5,572 | 0.111 | 616 | 0.01 |
| No.2 Mine | 1,634,488 | 0.145 | 237,596 | 5.22 |
| No.3 Mine | 152,015 | 0.22 | 33,423 | 0.73 |
| **Total:** | **26,623,123** | **0.17** | **4,554,167** | **100** |
| Note: Grade average is weighted average by tons milled | | | | |

Post-shutdown, Teck and Golden Pond formed the Teck-Golden Pond joint venture ("JV") and Teck and Tundra formed the Teck-Tundra JV to explore a portion of the historical Lamaque Property. The Golden Pond JV property was similar to the Property, which included most of the ground now owned 100% by Eldorado

(excluding the Tundra JV property) but in addition included two small claims on the southern limit of the Villemaque block (claims previously identified as 422883-2 and 421475-2). The Tundra JV included two non-contiguous parcels. The northern parcel of land was centred on the No. 5 Plug and the second parcel was centred on the No. 4 Plug. Teck was the operator for both the Golden Pond and Tundra JV programs.

Subsequently, in December 1988, Tundra signed an agreement with Teck to acquire a 100% interest in all of Teck's assets at Lamaque. The assets to be acquired included the Main Mine Property, all surface structures including the mill, surface and underground equipment, and Teck's interest in the Tundra, Golden Pond and Roc d'Or Mines agreements. The purchase price for the assets was $8,000,000. Tundra was also required to complete an exploration program and sink an exploration shaft to 304.8 m (1,000 feet) on the No. 4 Plug. Preliminary work was initiated to meet the obligations of the agreement but a downturn in the industry made funding difficult and the 1988 option was never exercised, leaving Teck with a 100% interest in the Main Mine and mill area, which it eventually optioned to Placer Dome. Subsequently Tundra's and Golden Pond's interest in the Tundra and Golden Pond JV properties was diluted due to non-payment of their respective portions of lease rentals, assessment filings and taxes. No exploration was conducted on the Tundra and Golden Pond JV properties between 1990 and 2003 until Kalahari and Teck Cominco signed their agreement providing Kalahari the option to earn Teck's interest in the JV properties. In 2009 Kalahari bought out the remaining Tundra and Golden Pond interests in the properties through a share swap. Kalahari changed its name to Integra in December 2010 and owns 100% of the property.

## 6.2 2003 – 2017

During the period from 2003 to 2017, exploration work was completed on the Lamaque Property, mainly consisting drilling campaigns. A total of 615,214 meters of drilling (1,632 DDHs) were completed mainly on Fortune, Parallel (including No. 10 Vein), Triangle, No. 6 Vein, No. 4 Plug, No. 5 Plug, Sigma Vein, Mylamaque, Geophysical Targets, Mine No. 3 and Sixteen Zone. The drilling was completed by Orbit-Garant Drilling from Val-d'Or, Québec. The analysis was completed by Bourlamaque Assay Laboratory and ALS Canada in Val-d'Or. The supervision of the exploration work completed between 2003 and 2008 was conducted by Mr. Don Cross and Mr. Terrence Coyle; between 2008 and December 2014, exploration work, drill planning, core logging, data validation and interpretation of mineralized zones were conducted and supervised by Geologica Groupe-Conseil Inc. with the help of Shawn Lavigne from C-Lab until 2012 and Integra for technical assistance and logistics between 2014 and July 2015.From 2015 to 2017, exploration work, drill planning, core logging, data validation and interpretation of mineralized zones were conducted and supervised by Integra Gold Corp.

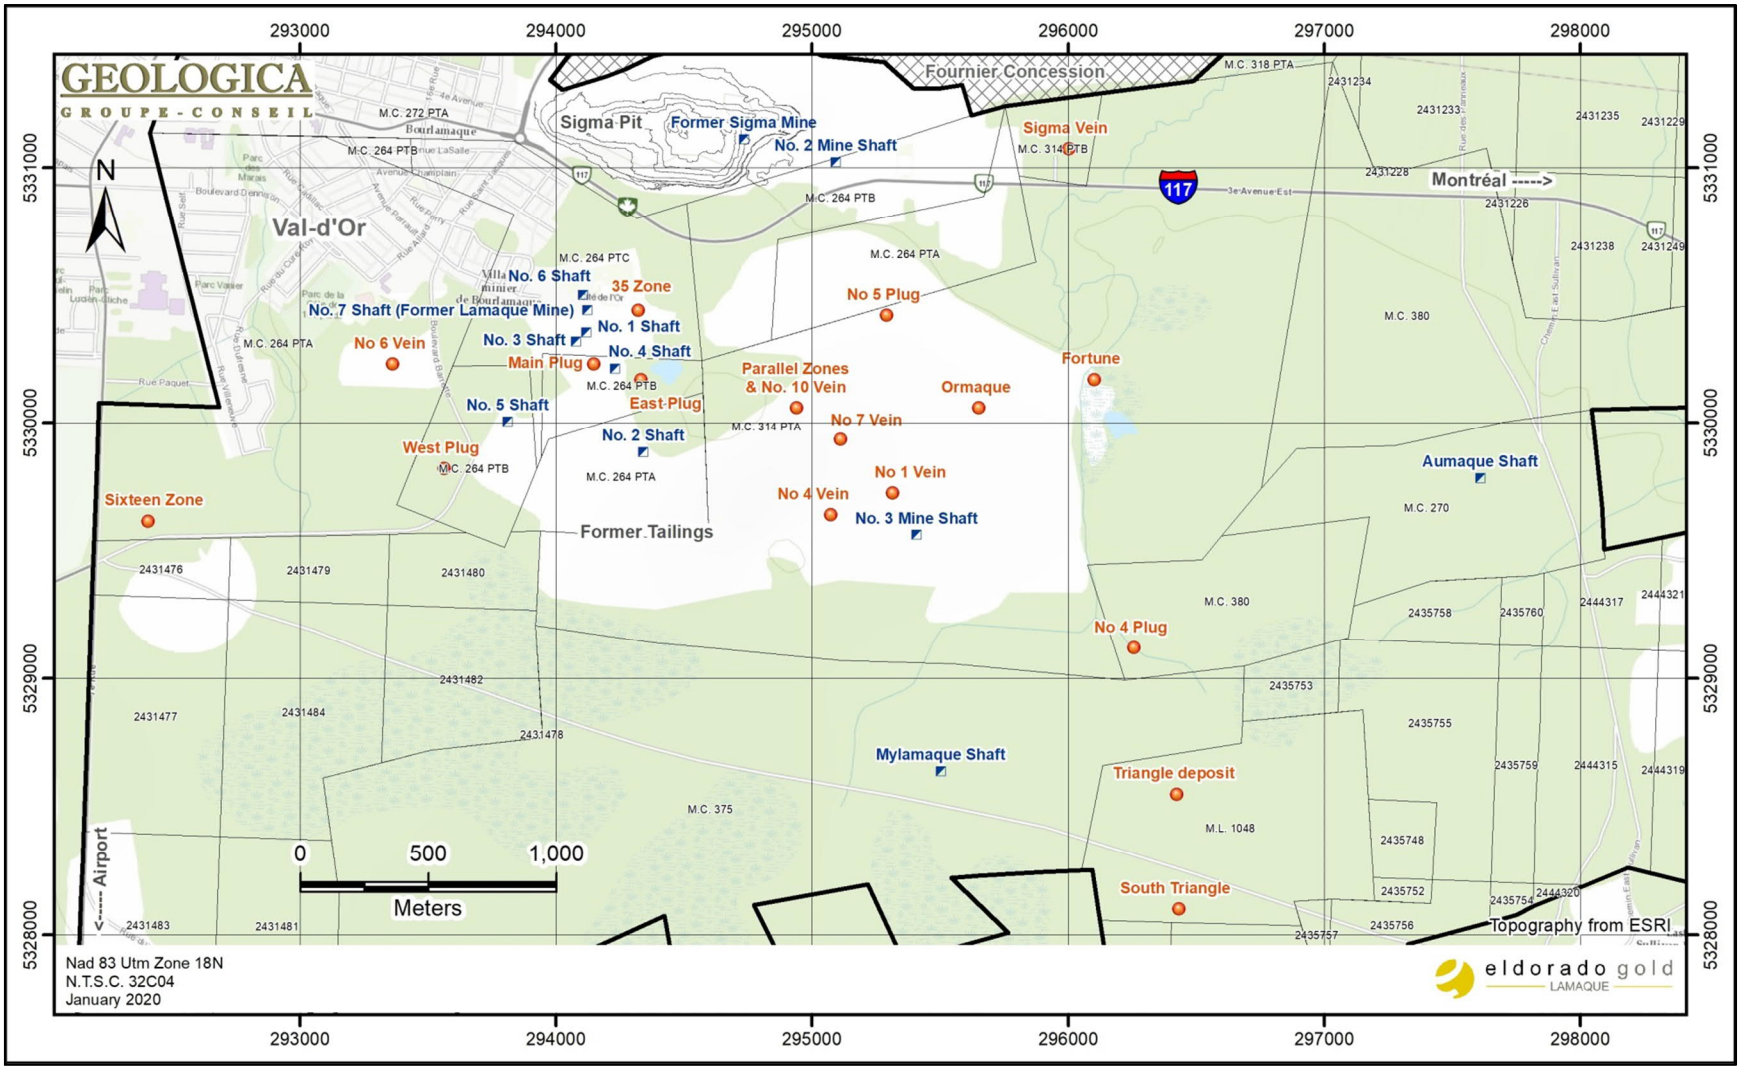

Figure 4 - Historical Shafts & Mineralized Zones on Lamaque Property

# 7.0 GEOLOGICAL SETTING AND MINERALIZATION

## 7.1 REGIONAL AND LOCAL GEOLOGY

The Property is located in the Malartic Composite Block, or Malartic Group, southeastern part of the Abitibi Greenstone Belt, an Island Arc volcanic complex, 750 km long by 250 km wide, of the Archean Superior Province, Canadian Shield. The Grenville Front is located about 50 km to the southeast and the Cadillac-Larder Lake Fault Zone, deformation zone or "Break" is located about 1 km south of the south edge of the Property. The Cadillac-Larder Lake Break runs for about 250 kilometers and is the fundamental control for gold mineralization in the Val-d'Or, Malartic, Cadillac and Kirkland Lake camps (Figure 5).

In the Malartic/Val-d'Or area, the Cadillac-Larder Lake Break separates the dominantly volcanic Malartic Block from the Pontiac Metasedimentary Subprovince to the south. The Bourlamaque Batholith hosts a number of former gold producers, (Bras d'Or, Belmoral, Stabell) and is located one mile northeast of the northeast corner of the Property while the East Sullivan Stock is located to the east. The regional stratigraphy for the area is summarized in the table below.

Regional Stratigraphy

| Unit Name | Description | Age |
|---|---|---|
| **Pontiac Group** | Greywacke and mudstone with minor conglomerate and ultramafic rocks | 2691-2682 Ma |
| **Kewagama Group** | Greywacke | |
| **Bourlamaque Pluton** | Tonalite-granodiorite | 2701±1Ma |
| **Louvicourt Group** | | |
| Héva Formation | Mafic to felsic volcaniclastics and volcanics | 2702±2Ma |
| Val d'Or Formation | Intermediate to felsic flows intercalated with volcaniclastic rocks | |
| **Transition Zone** | | 2704±2Ma |
| **Malartic Group** | | |
| Jacola Formation | Mafic volcanics and hyaloclastites with some intercalated ultramafics | |
| Upper Dubuisson | Mafic and ultramafic volcanics | |
| Lac Caste | Sedimentary Rocks | |
| Lower Dubuisson | Mafic and ultramafic volcanics | |
| La Motte-Vassan | Predominantly ultramafic volcanics with volcaniclastic | 2714±2Ma |

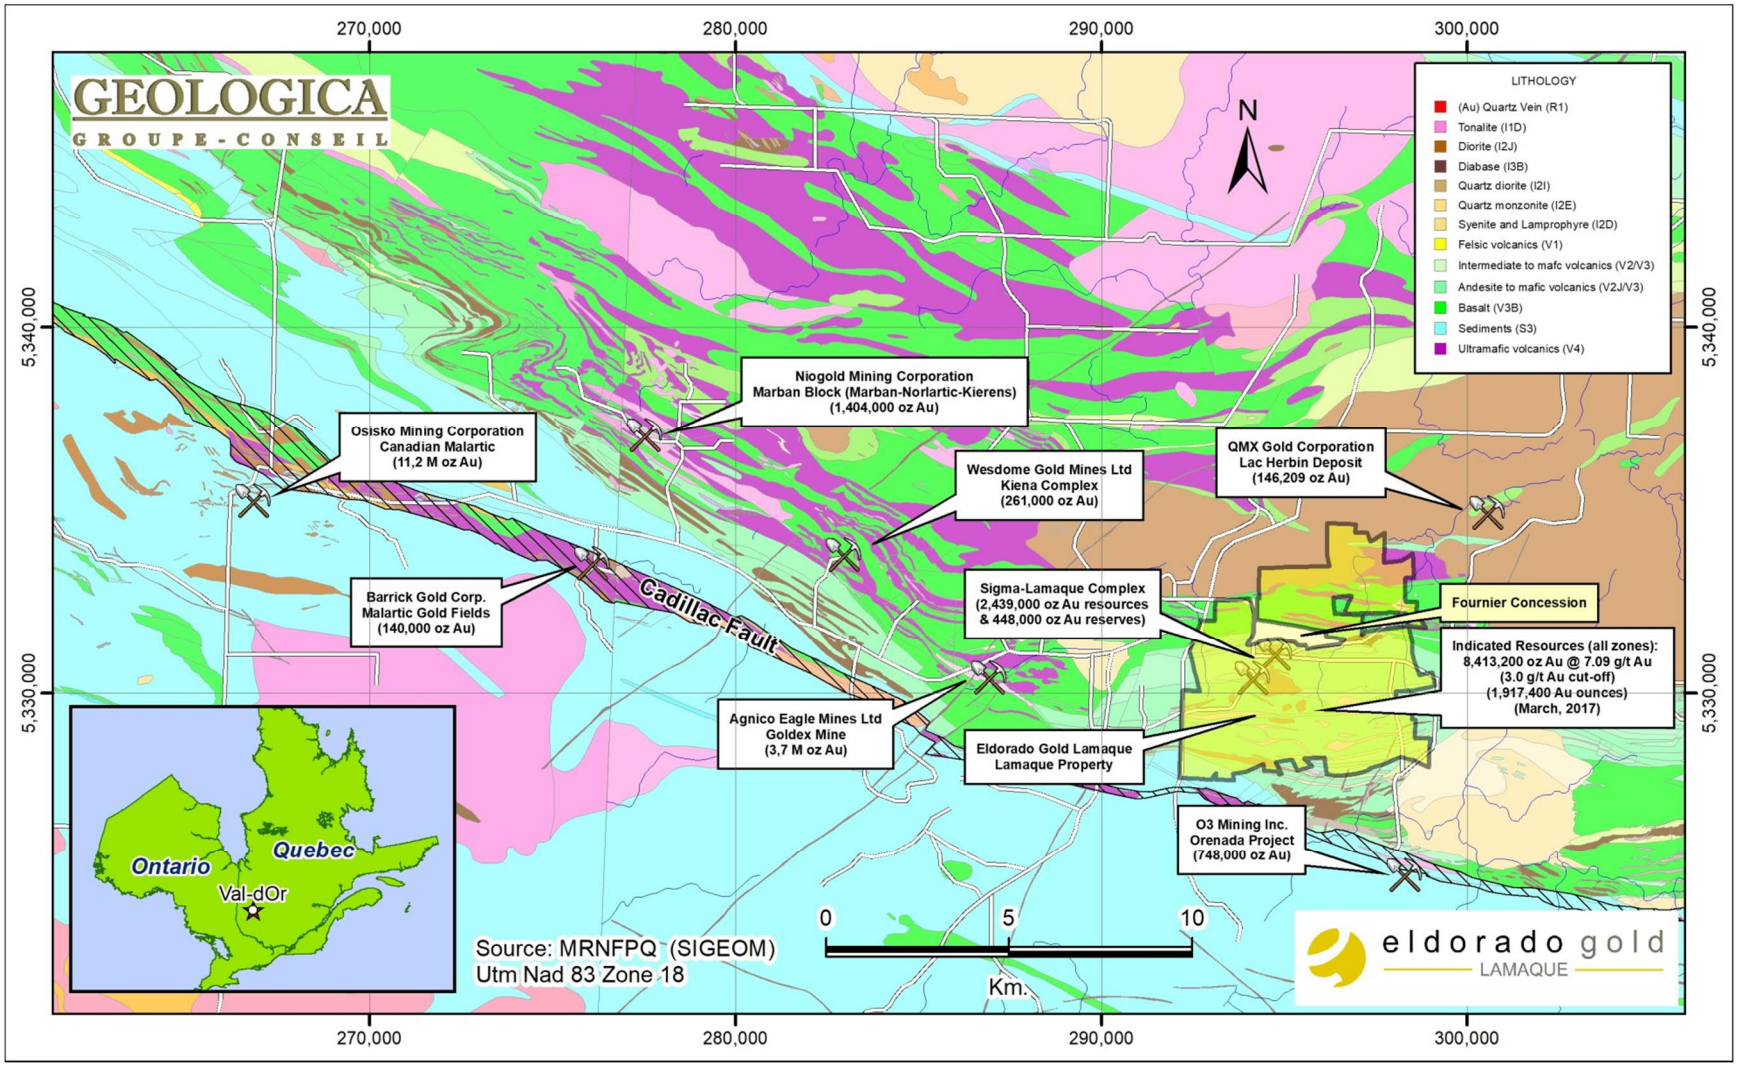

Figure 5 - Regional Geology

## 7.2 PROPERTY GEOLOGY

The Property is underlain principally by volcanic flows and volcaniclastics of the Val-d'Or Formation (2705-2703 Ma), intruded by a variety of intermediate to mafic plugs, dykes and sills. The northern part of the Property is underlain by lithologies comprising the lower part of the Val d'Or Formation, while the mid to southern part of the Property is underlain by units of the upper Val d'Or Formation. The extreme southern part of the Property, in the vicinity of the airport, is underlain by mafic volcanic units of the Héva Formation (Figure 6).

The Val-d'Or Formation is characterized by interstratified and overlapping massive to pillowed lavas and volcaniclastics of andesitic to rhyolitic composition. Reports also mention one horizon identified as an exhalative chert horizon and in another instance, a horizon of magnetic agglomerate. Ground magnetic surveys and interpretations for the most part have failed to resolve volcanic units of contrasting magnetic susceptibility. Areas of enhanced magnetic susceptibility have generally been interpreted to represent various intermediate porphyritic intrusives in the host volcanics rather than volcanic units of contrasting magnetic susceptibility. Magnetic surveys to date therefore have been of little help in deciphering stratigraphic and structural relationships. According to Scott (2002) and based on yttrium-zirconium ratios, the volcanics from the lower Val-d'Or Formation are tholeiitic to calc alkalic transitional while up-section, to the south, the upper Val d'Or units are transitional tholeiitic to calc-alkalic. Because of their intimate spatial association with most of the known gold mineralization, the intermediate to mafic, mostly granodiorite to dioritic plugs and associated porphyritic dykes and sills that intrude the Val-d'Or Formation are of particular importance. Structural and temporal relationships, however, remain enigmatic for some of these porphyritic rocks because of poor outcrop exposure and dominance of the pervasive and obliterating tectonic fabric.

Most of the gold production at the Lamaque Mine (immediately to the north of the Property) came from or was immediately adjacent to the Main Mine, largely in the Main Plug. Significant production also came from the East Plug at the east end of the Main Mine (also not on the Property). The Main Plug, measuring only 800 feet by 380 feet (243.84 x 115.82 m), is a chimney-like body and concentrically compositionally zoned. The outer rim of the body, in contact with its host volcanics, is diorite. Its diorite rim grades into a porphyritic quartz diorite and the core of the pipe is granodiorite. U-Pb zircon ages of 2685±3 Ma and 2682 Ma have been obtained on the Main Plug (Jemielita et al., 1990). The West Plug, southwest of the Main Plug, is only developed on a few levels and is a coarse porphyritic granodiorite. Similar pipe-like porphyritic intrusions, the No. 4 and No. 5 Plugs, occur on the Property. The No. 6 Plug may be partly on the Property. The No. 4 Plug measures 350 to 400 feet (106.68 x 121.92 m) in diameter and extends to a depth in excess of 3,000 feet (914.4 m). It appears to be a composite intrusion with a western portion which is granodioritic and an eastern portion which is a fine- to medium-grained diorite.

Burrows and Spooner (1989) reported that the Main, East and West Plugs are unusually sodic and enriched in barium and strontium and suggest these compositions are magmatic. Watts, Griffis and McOuat and Geologica consider that this sodium, barium and strontium enriched composition is more likely a reflection of gold-related hydrothermal alteration. As pointed out by Patton (1988) these plugs are foliated and have a consistent gross orientation with a steep ($70^{o}$) northeastern plunge. U-Pb zircon geochronology dates the Main Plug at 2682 to 2685 Ma (Corfu, 1993) making them Timiskaming in age, post volcanic but syntectonic.

More obscure are the various other porphyritic dykes and sills commonly intersected in drill holes and possibly concordant or sub-parallel with general stratigraphy, but perhaps also extensively cross cutting. These non-plug-likes, felsic to intermediate composition units are also important because of their common association with gold mineralization. Many of these bodies are dykes and/or sills but given the difficulties of geological mapping, poorly defined deformation and pervasive hydrothermal alteration, we would not rule out the possibility that some of these rocks represent flows or synvolcanic intrusions.

The volcano-sedimentary rocks have been metamorphosed to lower greenschist facies (quartz + sericite + albite + chlorite + carbonate + actinolite + chloritoid). Scott (2002) reports that all flow units of the Val d'Or Formation have undergone silicification, sericitization and carbonatization to some degree, probably as a function of their original porosity. Throughout the drill logs prepared by Teck for the Golden Pond and Tundra JVs, various types and extents of alteration are documented. In most cases the alteration that is described is immediately peripheral, or enveloping quartz-tourmaline veins in either volcanics or intermediate porphyritic rocks.

The volcanics, on a regional scale, strike east-west to northeast-southwest and dip steeply to the north or south. Robert and Brown (1986) state for units south of the Bourlamaque Batholith, bedding is overturned with younging directions mainly to the south. At the regional scale and on the Property, an east-west, steeply dipping tectonic fabric superimposed on the volcanic rocks obscures bedding in the volcanics. Teck's latest geological compilation maps by Madon (c. 1987) show very few stratigraphic orientations. Most of the measurements for orientation on outcrops are for schistosity, which is shown to be steeply dipping to vertical. Rarely are bedding attitudes shown. The few primary attitudes that have been mapped are contacts between volcanic rocks of contrasting texture and these often do not appear to parallel the strike of interpreted stratigraphy. Interpreted stratigraphy also does not always appear to parallel the trend of magnetic horizons.

Patton (1988) suggested that the volcanic rocks may be tightly folded with the "plugs" located at the fold noses. Tight folding would be compatible with regional interpretation. Patton also suggested that the "plugs" are in fact folded, and thickened sills or dykes occurring in the fold noses. Burrows and Spooner (1989) also suggested that the plugs represented the coalescence of parallel dykes.

## 7.3 MINERALIZATION

The more significant zones of gold mineralization or deposits known on the Property contain various simple vein structures, vein complexes and stockwork zones (Figure 6). These zones are listed here below:

- Triangle Deposit;
- South Triangle;
- Main Plug;
- East Plug;
- West Plug;
- No. 4 Plug;
- No. 5 Plug;
- Fortune Zone;
- Parallel Zones (including historical No. 10, 7 & 5 Veins);
- No. 3 Mine area (including No 1 & 2 Veins);
- No. 4 Vein;
- No. 6 Vein;
- No. 7 Vein;
- Sixteen Zone;
- Mylamaque Zone;
- Sigma Vein;
- Ormaque Zone;
- Past Sigma and Lamaque Mines.
- 35 Zone

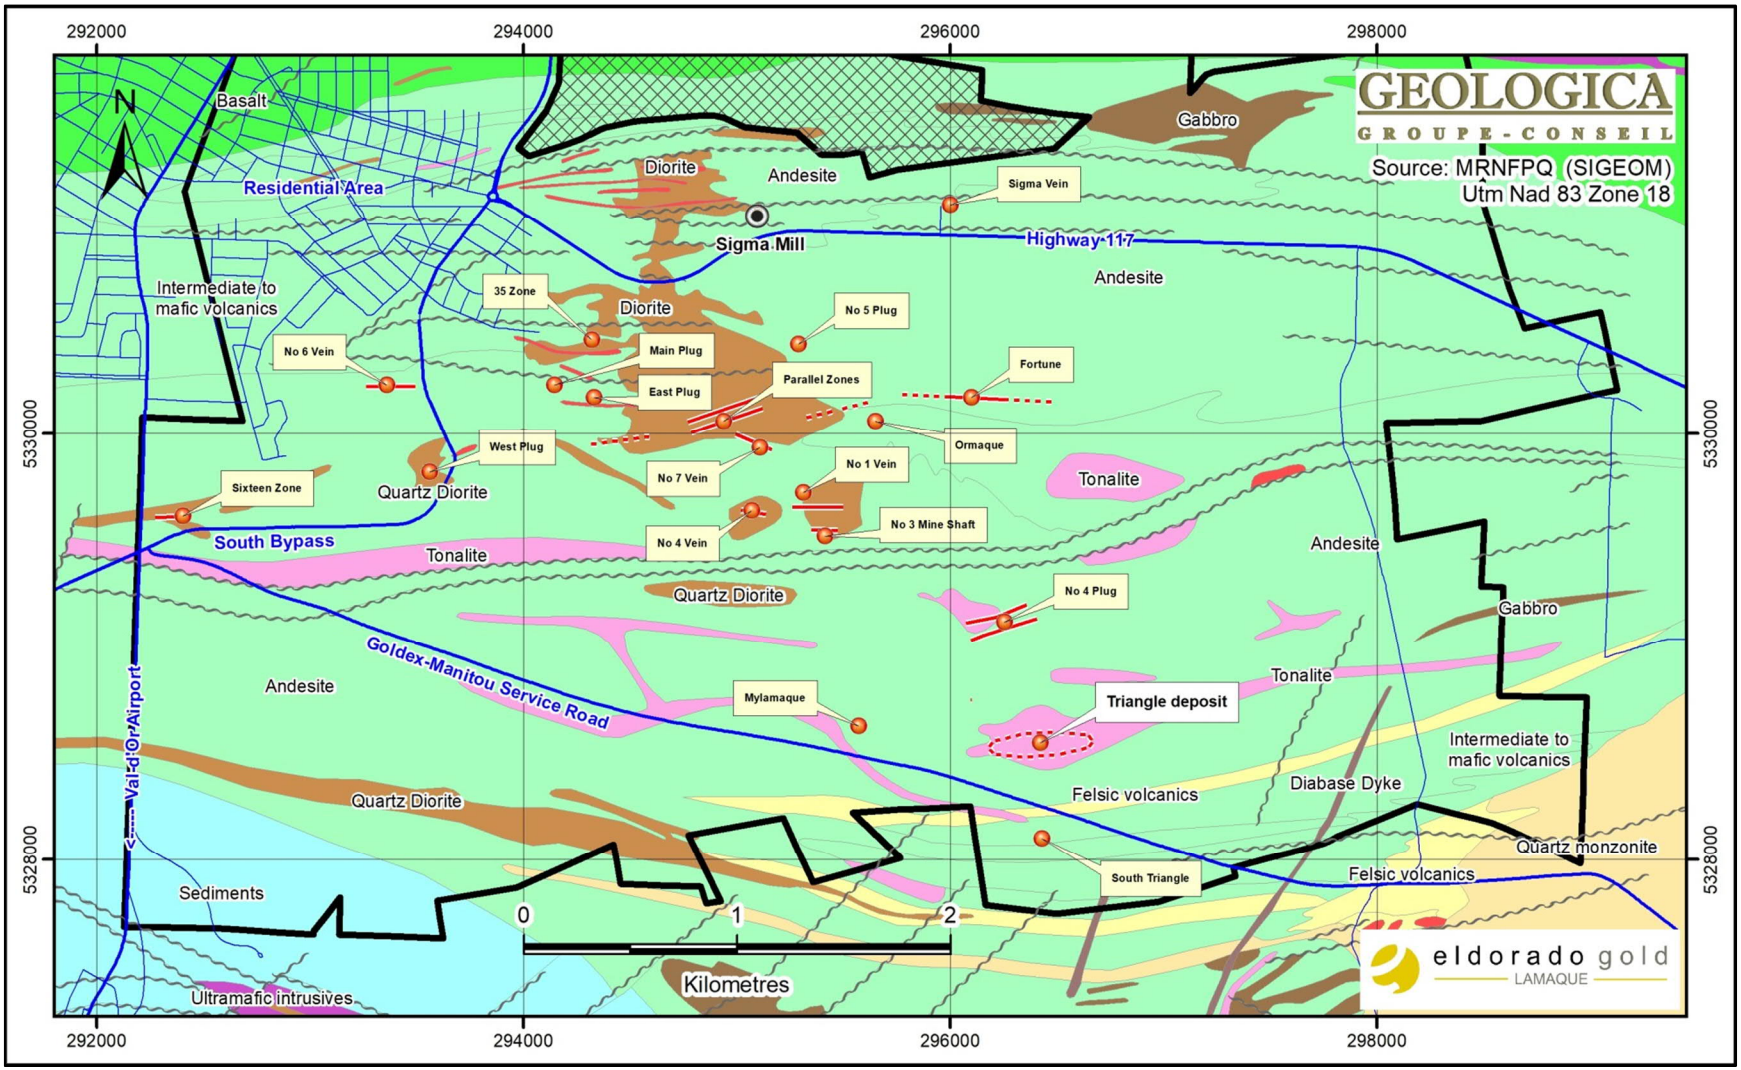

Figure 6 - Property Geology and Mineralized Zones

## 8.0 DEPOSIT TYPES

Karvinen (1985) proposed a volcanogenic origin and control for the Lamaque gold mineralization suggesting that many of the porphyry units were volcanic and the associated gold mineralization was exhalative. Uranium-Lead-Zircon age dating of various porphyritic units and mineralization and structural relationships have since proven that the gold-bearing quartz-tourmaline veins are significantly younger than their host rocks.

Burrows and Spooner (1989) proposed that the intrusive plugs (Main, West, and East), showed a primary, magmatic gold enrichment and inferred the ore bodies formed from the remobilization of this primary gold. According to Feng et al., (1993) the elevated gold values in samples from the intrusives are due to secondary enrichment in the halo of an ore-forming system.

Original opinion (Wilson, 1948) was that the Lamaque mineralization represented structurally controlled deposits. Wilson describes mineralization at the Main Plug as controlled by a series of east-west trending stacked thrust faults, which occur one below the other and dip into the intrusive with the gold-bearing quartz-tourmaline veins in the thrust faults and subsidiary fractures. Wilson also describes how competency of the host rock controls the expression of deformation and foliation associated with the faults and fractures. Wilson reported that movement along the faults, in hard competent rock, resulted in considerable fracturing and brecciation and the development of numerous flatly dipping tension fractures hosting numerous gold-bearing veins.

Similar descriptions to those related by Wilson are reported by Robert and Brown (1984 & 1986) in describing mineralization at the Sigma Mine, which represents the northern part of the same complex quartz-tourmaline vein system. The host rocks at Sigma, like those at Lamaque, are composed principally of andesitic flows, irregular intrusive bodies of porphyritic diorite and dykes of feldspar porphyry. Robert and Brown describe how the gold-bearing quartz tourmaline veins cut all rock-types, which include an irregular body of porphyritic diorite affected by regional deformation and greenschist grade metamorphism and younger feldspar porphyry dykes. Robert and Brown report that the gold-bearing veins were emplaced lately and were cut by diabase dykes and have not been subject to pervasive deformation and metamorphism. Two principal types of veins occur in the mine – subvertical veins and subhorizontal veins. Robert and Brown describe the subvertical veins as occurring within steeply dipping east-west trending ductile shear zones along which reverse subvertical displacements have taken place. The veins occupy openings created by irregularities during progressive movement within the shears. Subhorizontal veins occupy extensional fractures which formed between ductile shear zones, preferentially in the more competent host rocks.

Neumayr et al. (2000) present evidence that the mineralized zones and deposits at Lamaque and Sigma are second- and third-order structures related to deformation

along the Larder Lake-Cadillac Fault Zone, which represents the first-order structure. Similar models are commonly expressed for most gold mineralization associated with both the Larder Lake-Cadillac Fault Zone and the Destor-Porcupine Fault zones where splay faults which represent second order structures off the principal fault zones host the bulk of gold mineralization in the Timmins, Kirkland Lake and Val d'Or Camps.

Geologica agrees with Wilson (1948) and Robert and Brown (1986), that the mineralized zones are mesothermal structurally controlled deposits typical of the Abitibi Greenstone Belt and abundant in other Archean greenstone belts around the world. They believe, however, that in detail the property-scale controls for the zones of mineralization are not well understood. To Geologica's knowledge there is no understanding and explanation for the clusters of gold-bearing veins in the No. 3 Mine, No. 10 Vein and No. 6 Vein, Fortune (Formerly Forestel), Sixteen, Triangle or Mylamaque Zones aside from junctions of structures, faults and fracture networks near and/or within younger altered intrusive plugs of intermediate to mafic composition.

## 9.0 EXPLORATION WORK

No exploration work was completed by Eldorado in 2017-2019.

## 10.0 DIAMOND DRILLING

### 10.1 Southwest area

Seventeen (17) diamond drill holes were completed in 2018-2019 on the Exploration Program in the Southwest area (SO) of the Property in order to validate and follow-up on the mineralized zone intersected in 2015 and 2016. A total of 10,959.17 meters were drilled. Table 3 shows Technical Parameters and Map 1 in Appendix shows the location of these drill holes.

The drill core samples were assayed by Bourlamaque Assay Laboratory in Val-d'Or (Quebec). The planning, core logging, data validation and supervision of the 2018-2019 drilling program were completed by Eldorado with the data validation and QAQC.

Mainly lapilli and blocky tuffs were intersected. They often alternate with coarse grained diorite (Triangle Type = I2JT). Generally chloritized and carbonatized rocks are sheared and fractured. Also, some shear zones were intersected. Several mineralized veins were injected; their length varying between 0.5 cm and 40 cm with trace-1% of pyrite, locally 10%, and very locally trace-7% of chalcopyrite. They are made up of quartz-carbonate-tourmaline and/or chlorite-sericite-feldspar; epidote and calcite are rare.

In 2018-2019, Eldorado used appropriate QA/QC protocols employing duplicates, blanks and standards. A total of 2652 core samples were collected for a total sampled length of 1997.87 meters which represents 30% of total drillhole core length with 391 QA/QC control samples. Table 4 presents the most significant intersections more than 0.1 ppm (all assay results are available for the Laboratory Assay Results and DDH descriptions in Appendices I and II).

Table 4 - 2018-2019 Most Significant Intersections on the Southwest Area (SO)

## 10.2 Mylamaque area

Four (4) diamond drill holes were completed in 2017-2018 on the Exploration Program in the Mylamaque area (LS) of the Property in order to validate the potential mineralization similarly to Mylamaque zone. A total of 1,311.81 meters were drilled. Table 5 shows Technical Parameters and Map 1 in Appendix shows the location of these drill holes.

The drill core samples were assayed by Bourlamaque Assay Laboratory in Val-d'Or (Quebec). The planning, core logging, data validation and supervision of the 2018 drilling program were completed by Eldorado with the data validation and QAQC.

Table 5 - 2018 Technical Parameters on the Exploration – Mylamaque Area (LS)

| Drill Hole No. | East UTM83 | North UTM83 | Elevation | Azimuth | Dip | Length (m) |
|---|---|---|---|---|---|---|
| LS-17-001A | 293513.62 | 5328460.46 | 330.13 | 4.24 | -49.36 | 381.03 |
| LS-18-002 | 293709.31 | 5328480.08 | 325.72 | 355.58 | -51.14 | 407.38 |
| LS-18-004 | 293112.20 | 5328218.97 | 326.54 | 2.53 | -45.34 | 388.40 |
| LS-18-005A | 293089.10 | 5327929.08 | 331.12 | 7.40 | -49.05 | 135.00 |

Mainly lapilli and blocky tuffs were intersected. They often alternate with coarse grained diorite (Triangle Type = I2JT). Generally chloritized and carbonatized rocks are sheared and fractured. Also, some shear zones were intersected. Several mineralized veinlets were injected with trace-1% of pyrite, locally 5%,. They are made up of quartz-carbonate-tourmaline and/or chlorite-sericite-feldspar; epidote and calcite are rare.

In 2018, Eldorado used appropriate QA/QC protocols employing duplicates, blanks and standards. A total of 263 core samples were collected for a total sampled length of 186.28 meters which represents 14% of total drillhole core length with 36 QA/QC control samples. Table 6 presents the most significant intersections more than 0.1 ppm (all assay results are available for the Laboratory Assay Results and DDH descriptions in Appendices I and II).

Table 6 - 2018 Most Significant Intersections on the Mylamaque Area (LS)

| Drill Hole No. | From (m) | To (m) | Length (m) | Sample No. | Au (ppm) |
|---|---|---|---|---|---|
| LS-18-002 | 195.50 | 196.20 | 0.70 | E201466 | 0.17 |
| LS-18-002 | 197.00 | 197.50 | 0.50 | E201468 | 0.10 |

| LS-18-004 | 179.60 | 180.10 | 0.50 | I190595 | 0.22 |

## 10.3 Triangle area

One hundred sixty eight (168) diamond drill holes were completed in 2017-2019 on the Exploration Program in the Triangle area (TM) of the Property in order to validate and follow-up on the depth and lateral extensions of mineralized zone. A total of 65,374.86 meters were drilled. Table 7 shows Technical Parameters and Map 1 in Appendix shows the location of these drill holes. Several drill holes are now located within the Mining Lease. These drillholes were located in the Mining Claims in 2017.

The drill core samples were assayed by Bourlamaque Assay Laboratory in Val-d'Or (Quebec). The planning, core logging, data validation and supervision of the 2017-2019 drilling program were completed by Eldorado with the data validation and QAQC.

Table 7 - 2017-2019 Technical Parameters on the Exploration – Triangle Area (TM)

Mainly lapilli and blocky tuffs were intersected. They often alternate with coarse grained diorite (Triangle Type = I2JT). Generally chloritized and carbonatized rocks are sheared and fractured. Also, some shear zones were intersected. Several mineralized veins were injected; their length varying between 0.5 cm and 40 cm with trace-1% of pyrite, locally 10%, and very locally trace-7% of chalcopyrite. They are made up of quartz-carbonate-tourmaline and/or chlorite-sericite-feldspar; epidote and calcite are rare.

In 2017-2019, Eldorado used appropriate QA/QC protocols employing duplicates, blanks and standards. A total of 31,699 core samples were collected for a total sampled length of 26,473.10 meters which represents 41% of total drillhole core length with 4,623 QA/QC control samples. Table 8 presents the most significant intersections more than 0.1 ppm (all assay results are available for the Laboratory Assay Results and DDH descriptions in Appendices I and II).

Table 8 - 2017-2019 Most Significant Intersections on the Triangle Area (TM)

## 11.0 PREPARATION, ANALYSIS AND SECURITY

Drilling programs carried out by Eldorado from 2017 to 2019, all samples were assayed by Bourlamaque Assay Laboratories Ltd. (Val-d'Or, Quebec).

Procedures for routine fire assaying are to initially crush the entire sample to – 10 mesh, then a 300 g sub-sample is split and pulverized to 95 % - 150 mesh, and a 30 g sub-sample is fire assayed using standard industry procedures, with the gold content determined by atomic absorption spectrometry. For the Bourlamaque Assay Laboratories Ltd., each sample was assayed by Fire Assay and AA Finish, when values reporting ≥ 10 ppm Au are repeated by Fire Assay with a gravimetric Finish upper reporting limit of 100 g/t Au.

For security and quality control, diamond drill core samples were catalogued on sample shipment memos, which were completed at the time samples, were being packed for shipment. Duplicates and blanks were taken and the partial core was photographed by geologists. The splitting of samples and sample preparation for shipping were completed by Eldorado's technicians.

The material used for standards comprised certified reference material purchased from commercial facilities specializing in their manufacture (RockLab via Anachemia in Ontario and CND "Analytical Solution Limited"). All material used for blank samples consists of barren limestone. Laboratories also added their own quality control standards. In case of any doubt regarding the validity of a sample, the entire batch was re-assayed.

The authors believe that the sample preparation, security and analytical procedures are correctly applied. Results obtained by the laboratory are representative of the mineralization in comparison with results obtained in the past for all mineralized zones on the Lamaque Property.

### 11.1 Results of Quality Control

#### 11.1.1 Blanks

The field blank used in the 2017-2019 drilling programs is from a gold-barren sample of crushed white marble. One field blank is inserted for every 20 samples, alternating with standards. Geologica recommends a quality control protocol stipulating that if any blank yields a gold value above 20 ppb Au, the batch of sample containing the blank should be re-assayed. For 2017-2019 drilling program, no batch was re-assayed.

## 11.1.2 Certified Reference Material (Standards)

One certified reference material (CRM or "standard") was inserted for every 20 samples, alternating with blanks, during the 2018-2019 drilling programs. Nineteen (19) standards were used, with gold grades ranging from 0.340 g/t Au to 18.17 g/t Au as follows:

OREAS 200 with a theoretical value of 0.34 ± 0.01 g/t Au;
OREAS 205 with a theoretical value of 1.24 ± 0.05 g/t Au;
OREAS 209 with a theoretical value of 1.580 ± 0.04 g/t Au;
OREAS 214 with a theoretical value of 3.03 ± 0.082 g/t Au;
OREAS 215 with a theoretical value of 3.540 ± 0.097 g/t Au;
OREAS 216 with a theoretical value of 6.660 ± 0.16 g/t Au;
OREAS 217 with a theoretical value of 0.340 ± 0.01 g/t Au;
OREAS 221 with a theoretical value of 1.06 ± 0.04 g/t Au;
OREAS 238 with a theoretical value of 3.03 ± 0.08 g/t Au;
OREAS 229B with a theoretical value of 11.95 ± 0.288 g/t Au;
SP73 with a theoretical value of 18.17 ± 0.42 g/t Au;
SF85 with a theoretical value of 0.85 ± 0.02 g/t Au;
SL76 with a theoretical value of 5.96 ± 0.19 g/t Au;
SN75 with a theoretical value of 8.67 ± 0.20 g/t Au;
SJ80 with a theoretical value of 2.66 ± 0.06 g/t Au;
SF67 with a theoretical value of 0.84 ± 0.02 g/t Au;
SK78 with a theoretical value of 4.13 ± 0.14 g/t Au;
SE68 with a theoretical value of 0.60 ± 0.01 g/t Au;
SN74 with a theoretical value of 8.98 ± 0.22 g/t Au.

Eldorado's quality control protocol stipulates that if any analyzed standard yields a gold value above or below three times the standard deviation (±3SD) of the certified grade for that standard, then ten samples before and after the standard in the batch should be re-analyzed.

## 11.4.3 Duplicates

The quality control protocol requires a coarse duplicate be prepared for one sample selected among every 50 samples. The duplicate is prepared by taking half of the crushed material derived from the original sample. By measuring the precision of the coarse duplicates, the incremental loss of precision can be determined for the coarse crush stage of the process, thus indicating whether two sub-samples taken after primary crushing is adequate for the crushed particle size to ensure a representative sub-split.
Duplicates are used to check the representativeness of results obtained for a given population. To determine reproducibility, precision (as a percentage) is calculated according to the following formula:

$$\text{Precision (\%)} = \frac{\text{(Duplicate Sample Gold Grade – Original Sample Gold Grade)}}{\text{Average Between Duplicate Sample Gold Grade and Original Sample Gold Grade}} \times 100$$

Precision ranges from 0 to 200%, with the best being 0%, meaning that both the original and the duplicate sample returned the same grade.

The correlation coefficient (%) is given by square root of $R^2$ and represents the degree scatter of data around the linear regression slope. The results obtained indicate an excellent reproducibility of gold values for 2017-2019 with 90% to 100%.

## 12.0 DATA VERIFICATION

The authors reviewed and verified the existing data of all available past and recent reports. According to elements reported in the statutory documents, sampling works and the analysis thereof seem to have been made according to standards in force at that time and still valid today, although a procedure and method are not described. Duplicates, blanks and standards samples were taken every 20 samples, on average. The authors believe that the sample preparation, security and analytical procedures were correctly applied and correspond with the present standards applied in the mining industry.

## 13.0 MINERAL PROCESSING AND METALLURGICAL TESTING

No Mineral Processing and Metallurgical testing were completed by Eldorado recently.

## 14.0 MINERAL RESOURCE AND MINERAL RESERVE ESTIMATES

Table herebelow shows mineral reserves and resources on the Property (extract from the website of the company, September 30, 2019):

| Mineral Reserves and Resources | Metric Tonnes | Au (Grams per Tonne) | Ounces of Gold |
|---|---|---|---|
| Proven and Probable Reserves | 4,091,000 | 7.39 | 972,000 |
| Measured and Indicated Resources | 5,763,000 | 8.34 | 1,545,000 |
| Inferred Resources | 8,998,000 | 7.01 | 2,028,000 |

## 15.0 ADJACENT PROPERTIES

*The production, resource and reserve estimates indicated below are of a historical nature and do not comply with NI 43-101. However, the authors believe that this information gives a conceptual indication of the potential of the area and that it is pertinent to this report. The qualified persons have been unable to verify the information and the information is not necessarily indicative of the mineralization on the property that is the subject of the technical report.*

Contiguous and south of the Lamaque Property, a group of mining claims called the Central Cadillac Group Properties, is owned by O-3 Mining, consisting of the Alpha

Group (including Orenada Zones 2 & 4) and Akasaba Group, which have been explored by various holders since the early 1930's, with more than 2,400 drill holes completed since that time (Figure 7).

Contiguous and east of the Lamaque Property boundary, the 7-claim Aumaque property owned by Eldorado is underlain by intermediate to felsic tuffs with some diorite and feldspar porphyry dykes and sills from the Val d'Or Formation. Mineralization consists of auriferous quartz-pyrite-sphalerite-chalcopyrite-gold-silver veins hosted within an ENE-WSW vertical shear zone. In 1988 an Inferred Resource of 180,894 tonnes grading 8.57 g Au/t was reported (ref: MRNQ Deposit File # 32C04-0063). Since that time, more work has been conducted; however, the resource has not yet been confirmed.

Adjacent at the eastern and northern edge of the property, QMX Gold with its three past producing gold mines Dumont, Ferderber, and Lac Herbin are located within the Bourlamaque Batholith. The total production of these 3 mines has been reported as 4.1Mt grading 6.0 g/t Au for 792 650 ounces (NI 43-101 The Aurbel Group Properties, July 25th 2017 by David Rigg, P. Geo).

Further west of the Lamaque Property, the Goldex Mine, owned by Agnico-Eagle Mines, reported herebelow resources and reserves up to date in December 31, 2019:

| Mineral Reserves and Resources | Metric Tonnes | Au (Grams per Tonne) | Ounces of Gold |
|---|---|---|---|
| Proven and Probable Reserves | 18,925,000 | 1.58 | 962,000 |
| Measured and Indicated Resources | 27,773,000 | 1.88 | 1,683,000 |
| Inferred Resources | 27,791,000 | 1.50 | 1,338,000 |

Val d'Or camps have produced over 45 million ounces of gold since the 1930s and presently encompass seven producing gold mines (15 million ounces in reserves).

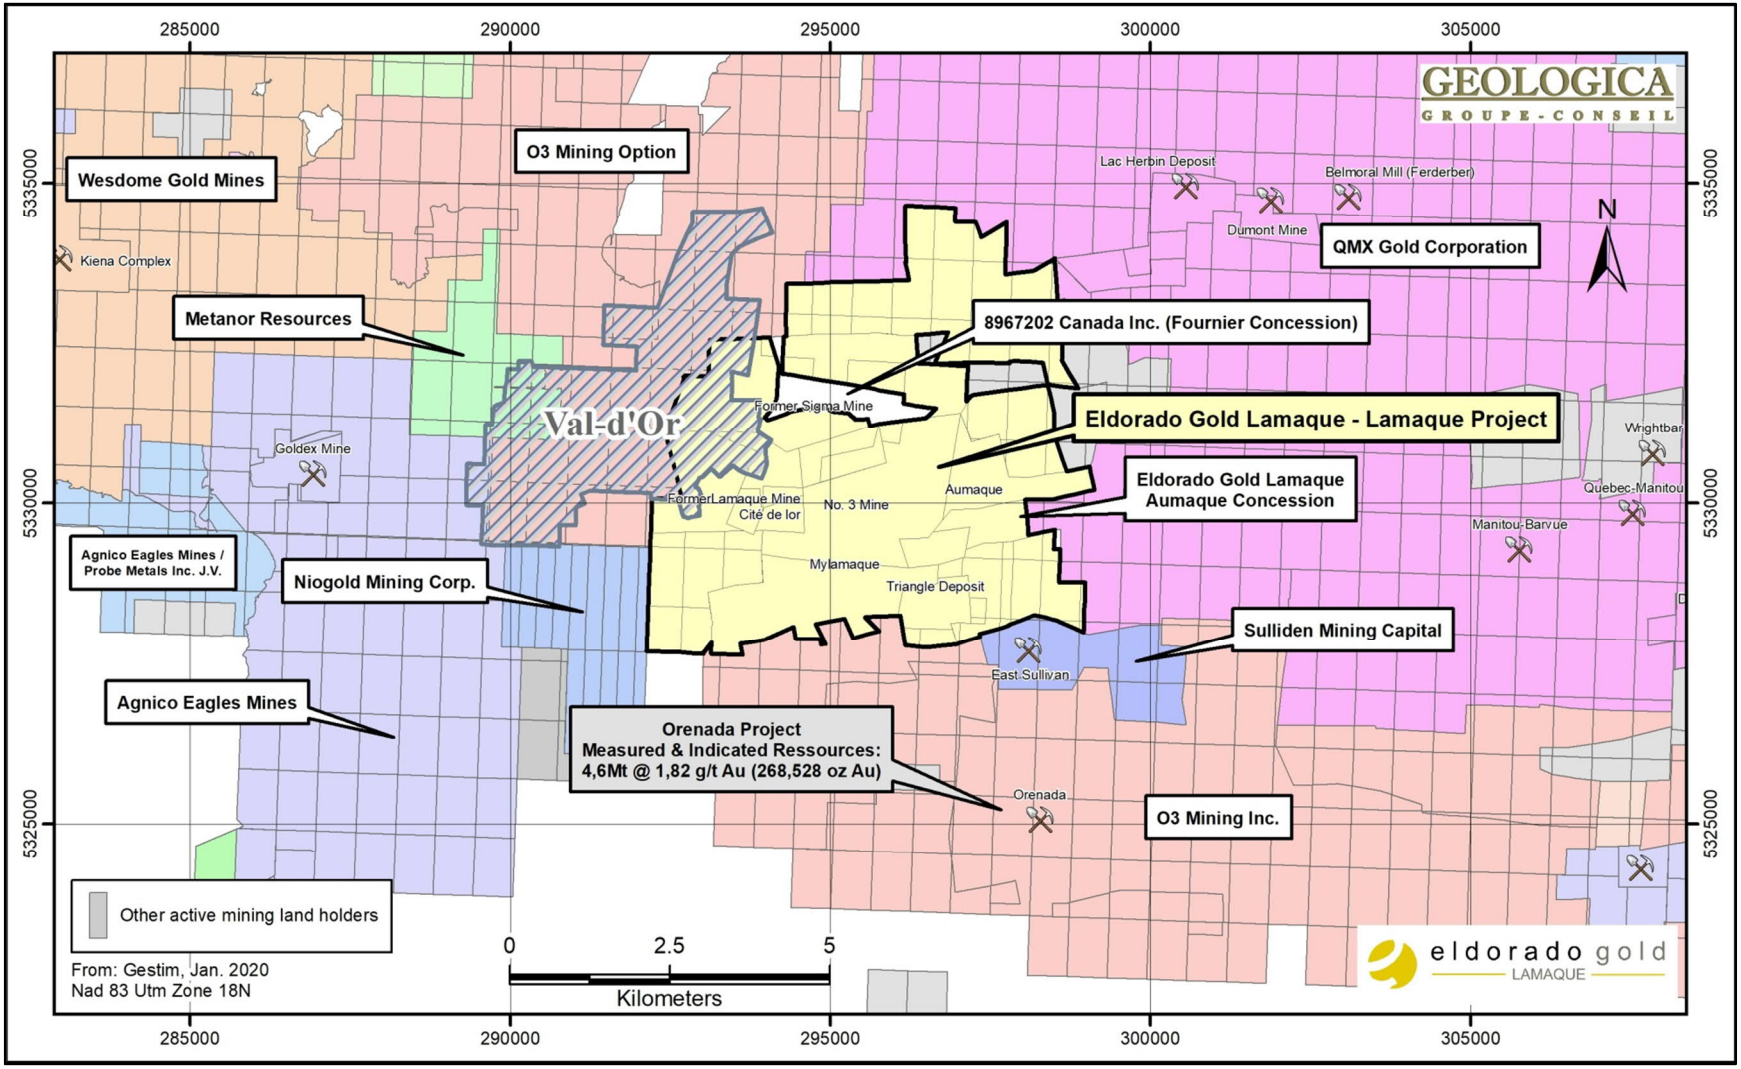

Figure 7 - Adjacent Properties

## 16.0 OTHER RELEVANT DATA AND INFORMATION

Geologica knows of no additional information necessary to make this report more consistent. That report has been prepared to accurately reflect the information collected, processed and validated.

## 17.0 INTERPRETATION, CONCEPT AND CONCLUSIONS

Geologica considers that the Lamaque Property has an excellent potential for further discoveries of economic gold mineralization and that the fundamental control on mineralization is structural and associated with young or late intrusive plugs, dykes and sills of felsic to mafic composition. Increasing knowledge of the details of the property-scale controls and structures will help orient and focus future drilling programs. Geologica believes that Eldorado should continue to refine its understanding of the structural complexity to help interpret and define potentially mineralized shear and fault structures, both cross cutting and parallel to stratigraphy. The magnetic data should help identify the presence of altered fractured intrusions of felsic to mafic composition. Thereafter follow-up exploration, including surveys, prospecting and drilling should be conducted.

Past and recent exploration works increased the potential of the known altered deposits, mineralized zones and their lateral and depth extensions as well as new prioritized geophysical, geochemical and geological coincident anomalous areas. Some reconnaissance and definition drilling is warranted to validate all the significant targets.

## 18.0 RECOMMENDATIONS

Geologica considers that the fundamental controls of the mineralization on the Lamaque Property are structural, and recommends that a structural interpretation to define potentially mineralized shear and fault structures (both cross cutting and parallel to stratigraphy) be continued and refined. A comprehensive digital database which is already ongoing needs to be continuously followed and compiled. Compilation of all drillholes information, including surface exploration surveys, geology, assay results and all technical surveys will continue.

Geologica believes more exploration and definition drilling is warranted to better define and test for lateral and at depth extensions of the known zones and to explore for other mineralized zones in the hosting structures. Complementary exploration work including compilation and interpretation of past drill holes, and complementary drilling on Southwest Area is recommended to evaluate the depth and lateral extensions.
